

# E-ELT DRM

## The Physics and Mass Assembly of Galaxies

Update

**M. Puech, P. Rosati, A. Cimatti, S. Toft**

# Pipeline updates

- **Complete sky model (Mauna Kea), including OH sky lines**

<http://www.gemini.edu/sciops/ObsProcess/obsConstraints/ocSkyBackground.html>

- **Thermal background : from EAGLE preliminary study - in agreement with TMT/GMT studies**

→ Telescope:  $T=280K$   $\epsilon=5\%$

→ Target aquisition system:  $T=240K$   $\epsilon=15\%$

→ Spectrograph:  $T=150K$   $\epsilon=69\%$

# Pipeline validation

Genzel et al. (2006)

SINFONI data

$$R_{\text{gal}} \sim 0.8'', M_{\text{tot}} = 1.1 \times 10^{11} M_{\odot}, M_{*} = 8 \times 10^{10} M_{\odot}$$

$$V_c = 230 \text{ km/s}, \text{EW}_{\text{rest}} = 140 \text{ \AA}$$

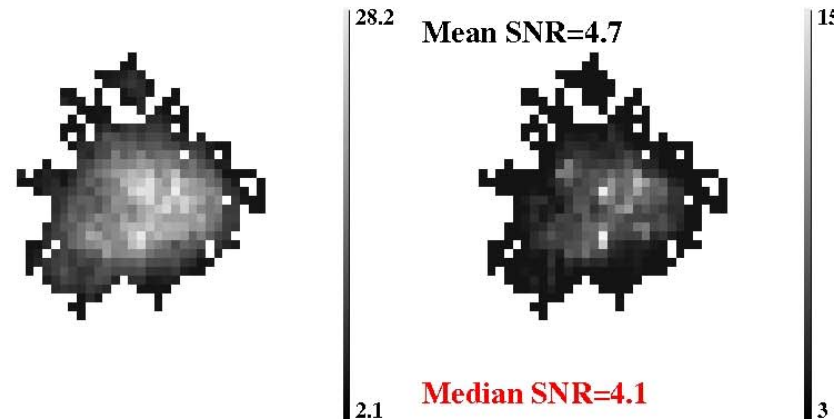

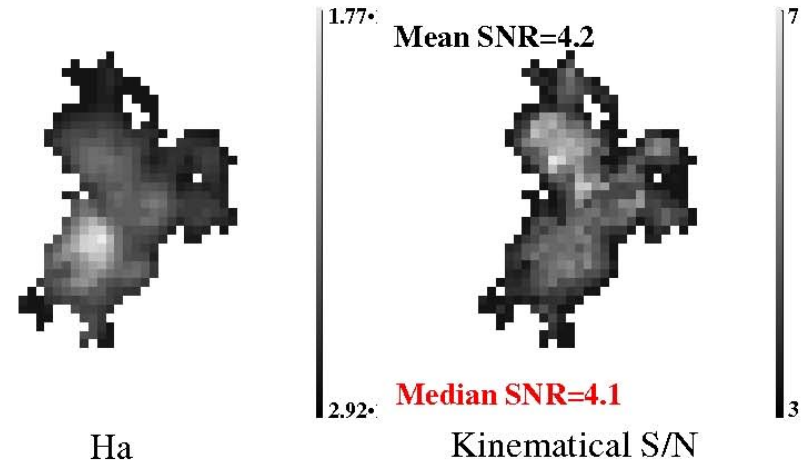

$z = 2.3834$

$K = 21.47$

$\text{EW}_0(\text{H}\alpha) = 140 \text{ \AA}$

$T_{\text{intg}} = 6 \text{ hr}$

$50 \times 100 \text{ mas FWHM} = 150''$  (smoothed to  $190''$ )

# SNR/Mass limit for 3D studies ?

- We define  $M_{\text{lim}} = M_{\text{stellar}} @ \text{SNR}=5$  (spatial mean in the [OII] emission line), set up from kinematical studies
- $\text{SNR} = \text{SNR}(\text{SB}, z, \text{EE}, \text{D}, \text{EW}_0, T_{\text{exp}}, \text{R}, \Delta \text{pix}, \dots) \rightarrow M_{\text{lim}} = M_{\text{lim}}(\text{SB}, z, \text{EE}, \text{D}, \text{EW}_0, T_{\text{exp}}, \text{R}, \Delta \text{pix})$

## Reference case ( $z=4$ , $M^*$ galaxy)

### Physical params

$z=4$ ,  $H_{\text{AB}}=24.3$  ( $M^*$  @  $z=4$ )  
 $V_{\text{max}} \approx 230$  km/s  $\rightarrow \text{Log}(M^*)=10.7 M_{\odot}$   
 $\text{EW}_0=30\text{\AA}$  ([OII] in H band)  
 $R_{\text{H}}=200$  mas,  $R_{\text{gal}}=4R_{\text{H}}=0.8''$  (5.6 kpc)

### Instrument params

$D=42\text{m}$   $\text{ExpTime}=24\text{h}$   
 $R=5000$   $\Delta_{\text{pix}}=50$  mas

# MOAO – « EAGLE »

Impact of EE on  $M_{\text{lim}}$ :  $M_{\text{lim}}(\text{SB}, z, \text{EE}, D, \text{EW}_0, T_{\text{exp}}, R, \Delta\text{pix})$

$\Delta\text{EE} = 11.7$  to  $38.4\%$

$\Delta\text{SNR} \sim 0.1 \Delta\text{EE}^{\text{MOAO}}$

→  $\Delta\text{SNR} \sim 2.7$  small impact of EE

We can choose a « representative » MOAO PSF:

EE  $\sim 21\%$  SNR  $\sim 12$

→  $\Delta\text{SNR}/\text{SNR} \sim 0.2$

Log SNR  $\sim \text{Log}(M/M^*)$

$\Delta\text{SNR}/\text{SNR} \sim \Delta(M/M^*)/(M/M^*)$

$\Delta\text{EE}$  leads to  $\Delta(M/M^*)/(M/M^*) \sim 0.2$

→  $M_{\text{lim}} = M_{\text{lim}}(\text{SB}, z, \text{EE}, D, \text{EW}_0, T_{\text{exp}}, R, \Delta\text{pix})$

# MOAO – « EAGLE »

Impact of Telescope/instrument:  $M_{\text{lim}}(\text{SB}, z, \text{D}, \text{EW}_0, T_{\text{exp}}, \text{R}, \Delta\text{pix})$

$M_{\text{lim}}$  scales as:

$42\text{m}/\text{D}$

$30\text{\AA}/\text{EW}_0$

$\sqrt{(24\text{hr}/T_{\text{exp}})}$

$\sqrt{(\text{R}/5000)}$

$50\text{mas}/\Delta\text{pix}$

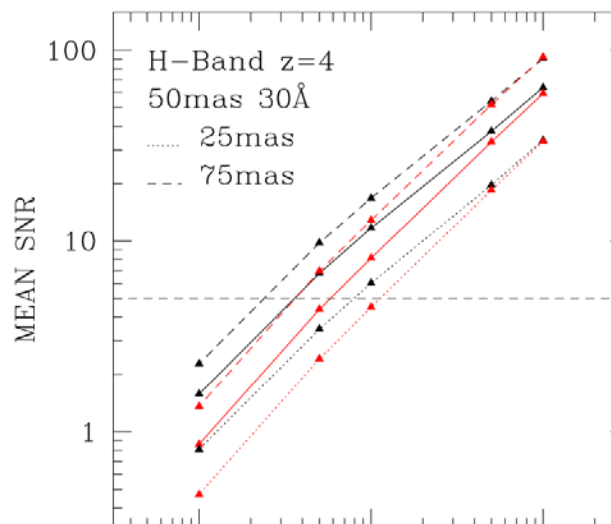

Accuracy:  $\pm 0.1 M^*$

$M_{z=4}^*$

$M_{z=4}^*$

$M_{z=4}^*$

$M_{z=4}^*$

# MOAO – « EAGLE »

Impact of SB on  $M_{\text{lim}}$ :  $M_{\text{lim}}(\text{SB}, z, D, \text{EW}_0, T_{\text{exp}}, R, \Delta\text{pix})$

Sp: UGC5253 - UGC6778

Major Merger: Sbc/Sbc – ARP271

Irr: UGC7592 - UGC7278

→  $\Delta(M_{\text{lim}}/M^*) = 0.15$  to  $0.58$

→  $M_{\text{lim}}/M^* = 0.365 \pm 0.215$

Impact of z on  $M_{\text{lim}}$ :  $M_{\text{lim}}(\text{SB}, z, D, \text{EW}_0, T_{\text{exp}}, R, \Delta\text{pix})$

$M_{\text{lim}}/M^* (z=2) = 0.2 \pm 0.08$

$M_{\text{lim}}/M^* (z=5.6) = 3.01 \pm 1.39$

$M_{\text{lim}}(z) \sim 0.195 + 0.0001527 \cdot \exp(z/0.57)$

$M^*_{z=4}$

# MOAO/GLAO

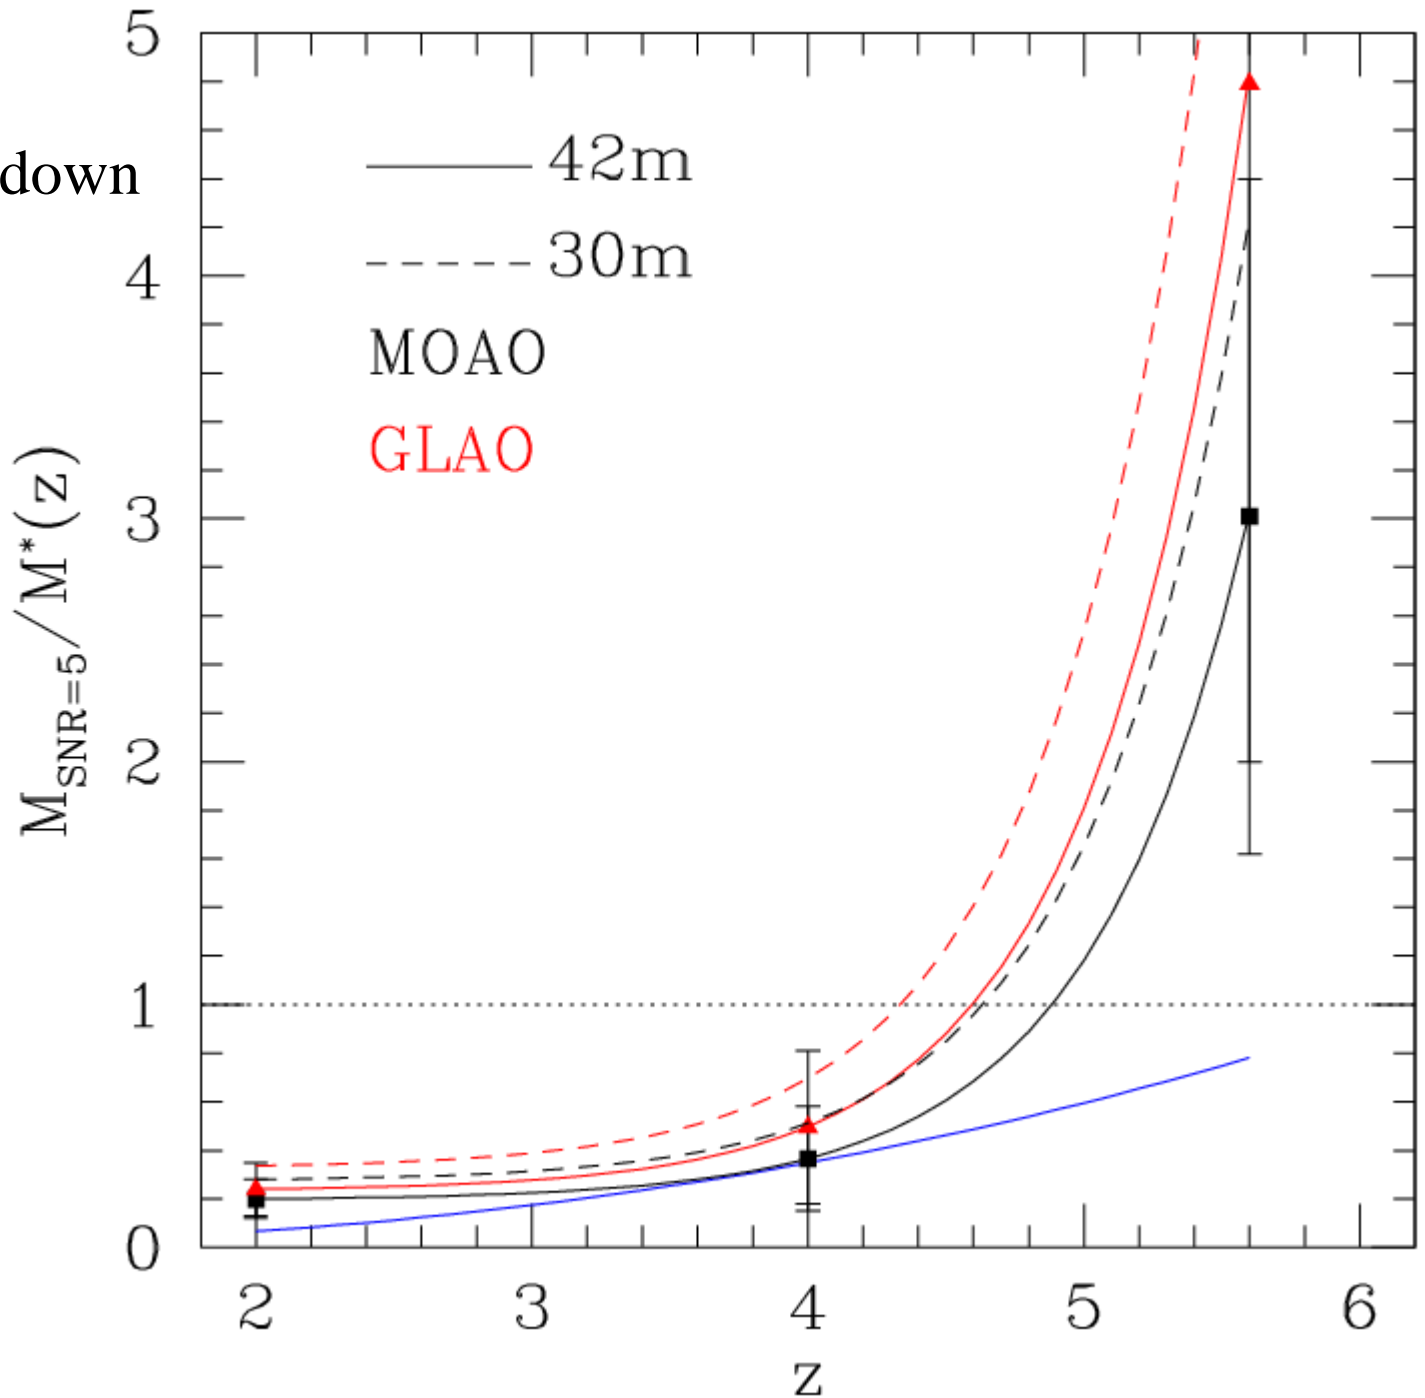

The MF can be probed down  
to  $M^*$  up to:

With a 42m telescope:

- with MOAO:  $z \sim 4.9$
- with GLAO:  $z \sim 4.6$

With a 30m telescope:

- with MOAO:  $z \sim 4.6$
- with GLAO:  $z \sim 4.3$

# Kinematical classification: rotating disk

# Rotation Curves (UGC5253)

- ✓ Accuracy on the RC is limited by the spatial resolution and sampling
- ✓  $z=2$ :  $\text{FWHM}_{\text{MOAO}} \sim 12 \text{ mas}$      $\text{FWHM}_{\text{GLAO}} \sim 161 \text{ mas}$      $D_{\text{gal}}/2\Delta \text{pix} = 17$
- ✓  $z=4$ :  $\text{FWHM}_{\text{MOAO}} \sim 11 \text{ mas}$      $\text{FWHM}_{\text{GLAO}} \sim 235 \text{ mas}$      $D_{\text{gal}}/2\Delta \text{pix} = 8$

# Summary

- Simulation pipeline now complete and successfully compared to SINFONI observations @  $z=2.38$ . Need for a sky model for Paranal.
- Reliable kinematics out to  $z\sim 5.6$  of super- $M^*$  galaxies. The Galaxy Mass Function can be sampled down to  $M^*$  up to  $z\sim 4.9$  using MOAO. Kinematical classification possible tools. RCs (plateau) recovered up to  $z\sim 2$  (Bosma thumb :  $D_{gal}/2D_{pix} > 14$ ).
- No breaking points in telescope diameter ( $z\sim 4.9$  30m telescope). SNR scales as  $D$ , so loss  $\sim 42\%$  can be compensated by longer exposures (eg,  $2^4$ ).
- GLAO : not significantly different from MOAO classification when enough SNR is provided. Holographic provides us with a better resolution  $\rightarrow$  better results.
- *ToDo: MCAO/LTAO single IFU case*
- *ToDo: Influence of knotty/clumpy galaxies: simulations of F. Bournaud (see astro-ph/0708.0306)*
- *Galaxy mass assembly DRM almost completed*

$t=350$  Myr

# Pipeline updates

- **GLAO PSFs:** **EE in 100 mas**
