Santiago, September 29th 2015

Introduction

Meteorite/Asteroid Impacts as a main geological process in the Solar System

The study of the flux of ET matter to Earth from Atacama desert

Chile and its record of impact events

Monturaqui crater (and others)

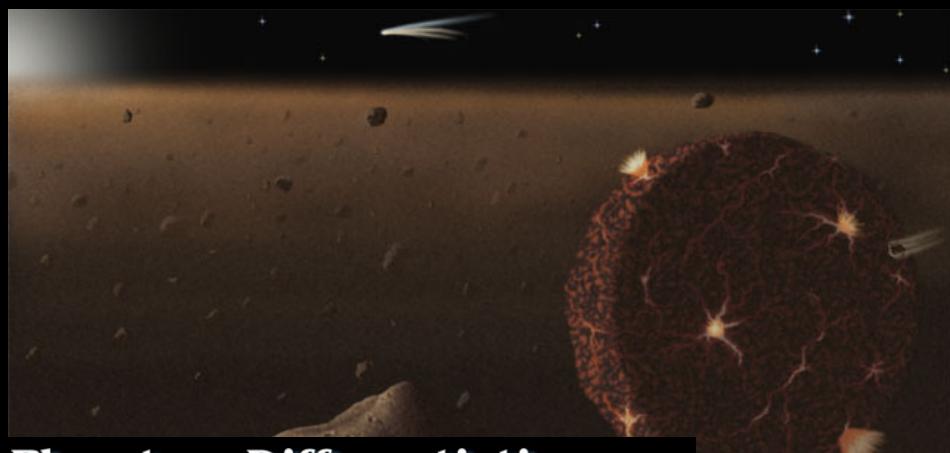

New tektite field: Atacamaites

Possible Pleistocene-Holocene Tunguska-like event

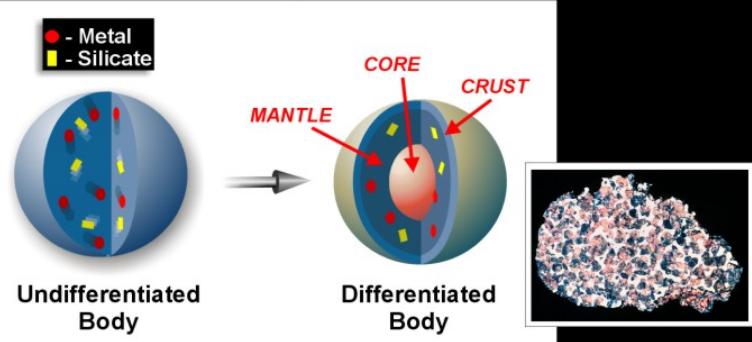

Astrobiological perspective

Future work

Introduction impact process SS * Atacama * Chile: Monturaqui Atacamaites Tunguska-like Future

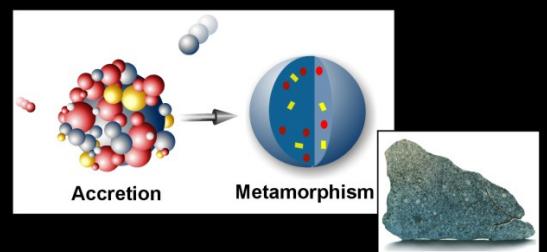

Planetary Differentiation

4515-4500 Ma

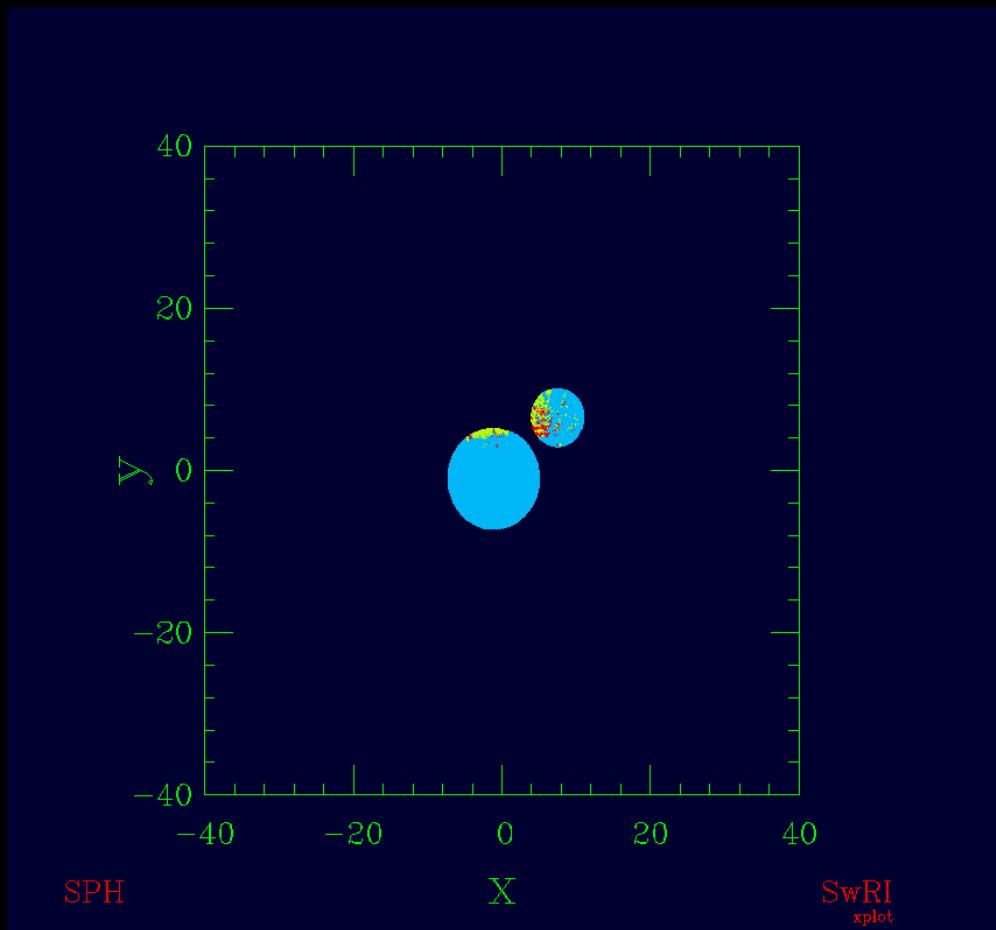

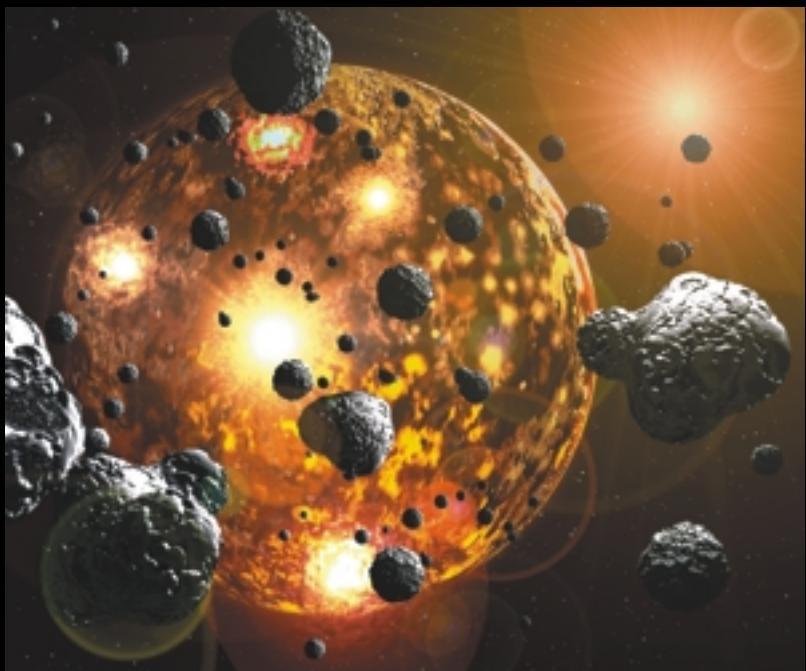

Accretion

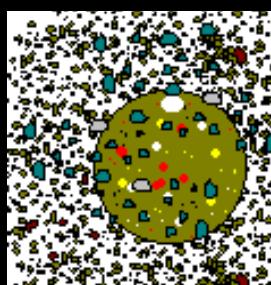

Moon formation for giant impact

~4500 Ma

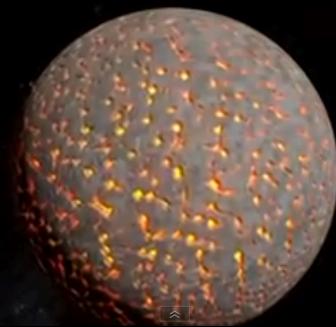

Robin Canup/Southwest Research Institute.

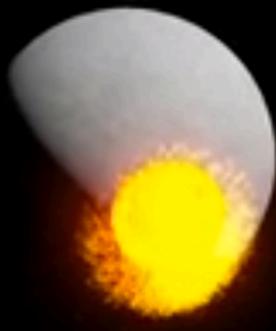

Relative ages of the moon surfaces

ca. 4,5 -4,3 Ga

Introduction impact process SS * Atacama * Chile: Monturaqui Atacamaites Tunguska-like Future

Mercury

Venus

Moon

Earth

Mars

1500 m

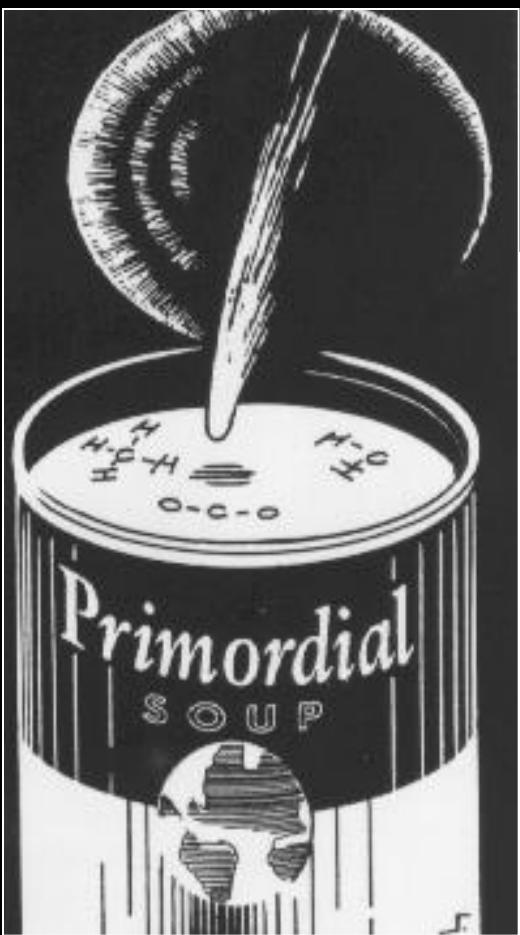

Asteroids

Comets and meteorites brought the building blocks for life

Impacts promote fracturing of rocks, generation of structures that can sustain life

... + planetary conditions

CO₂, CO, N₂, H₂S, H₂O, CH₄

CO₂, NH₃, H₂S, H₂O

Amino acids, nucleobases,
sugars, lipids, oligomers of
biochemical compounds

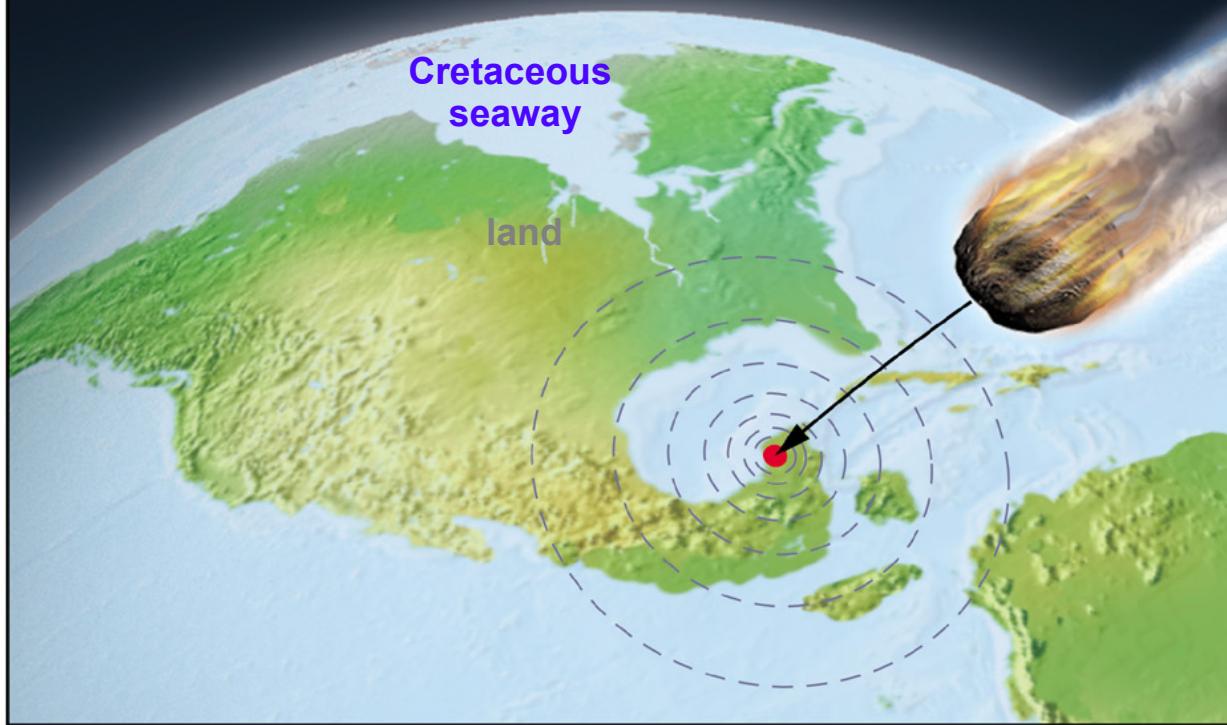

Lazcano, Natural History(Feb/2006)

Black smokers

Extinctions

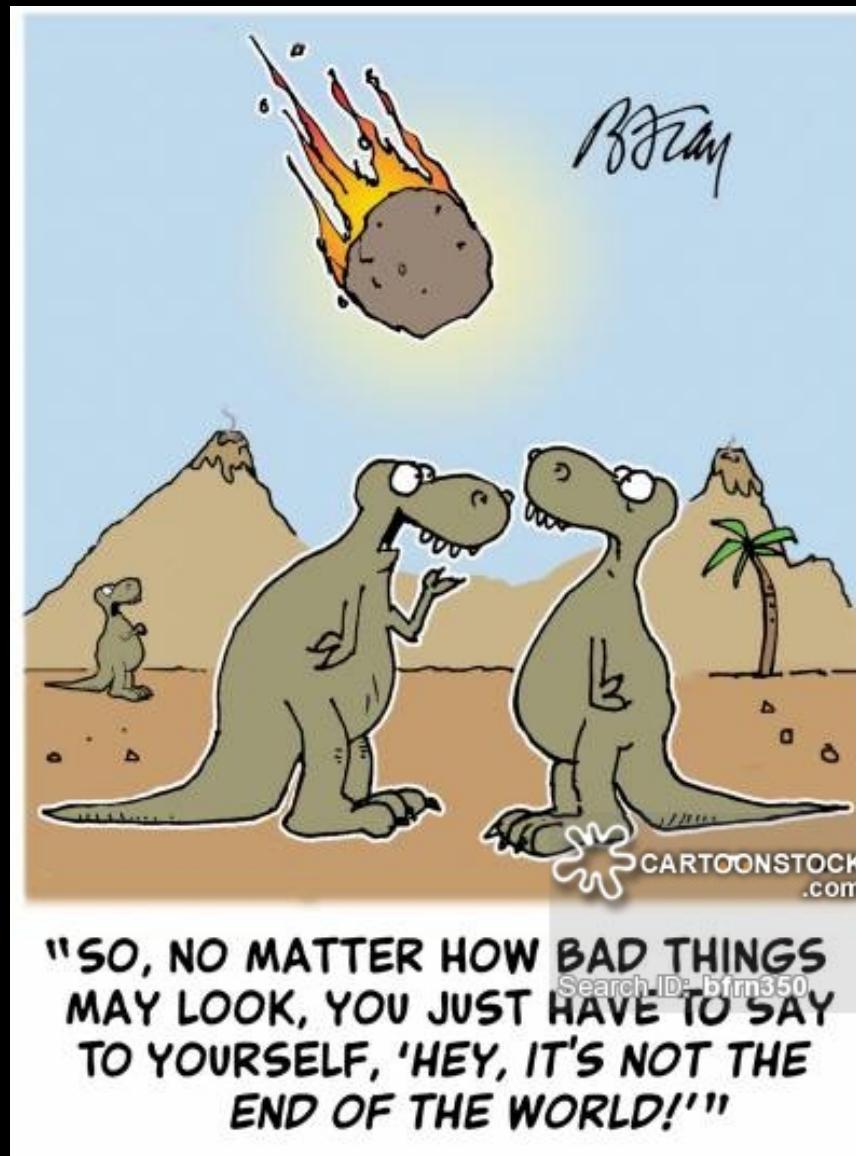

K-T Asteroid Impact

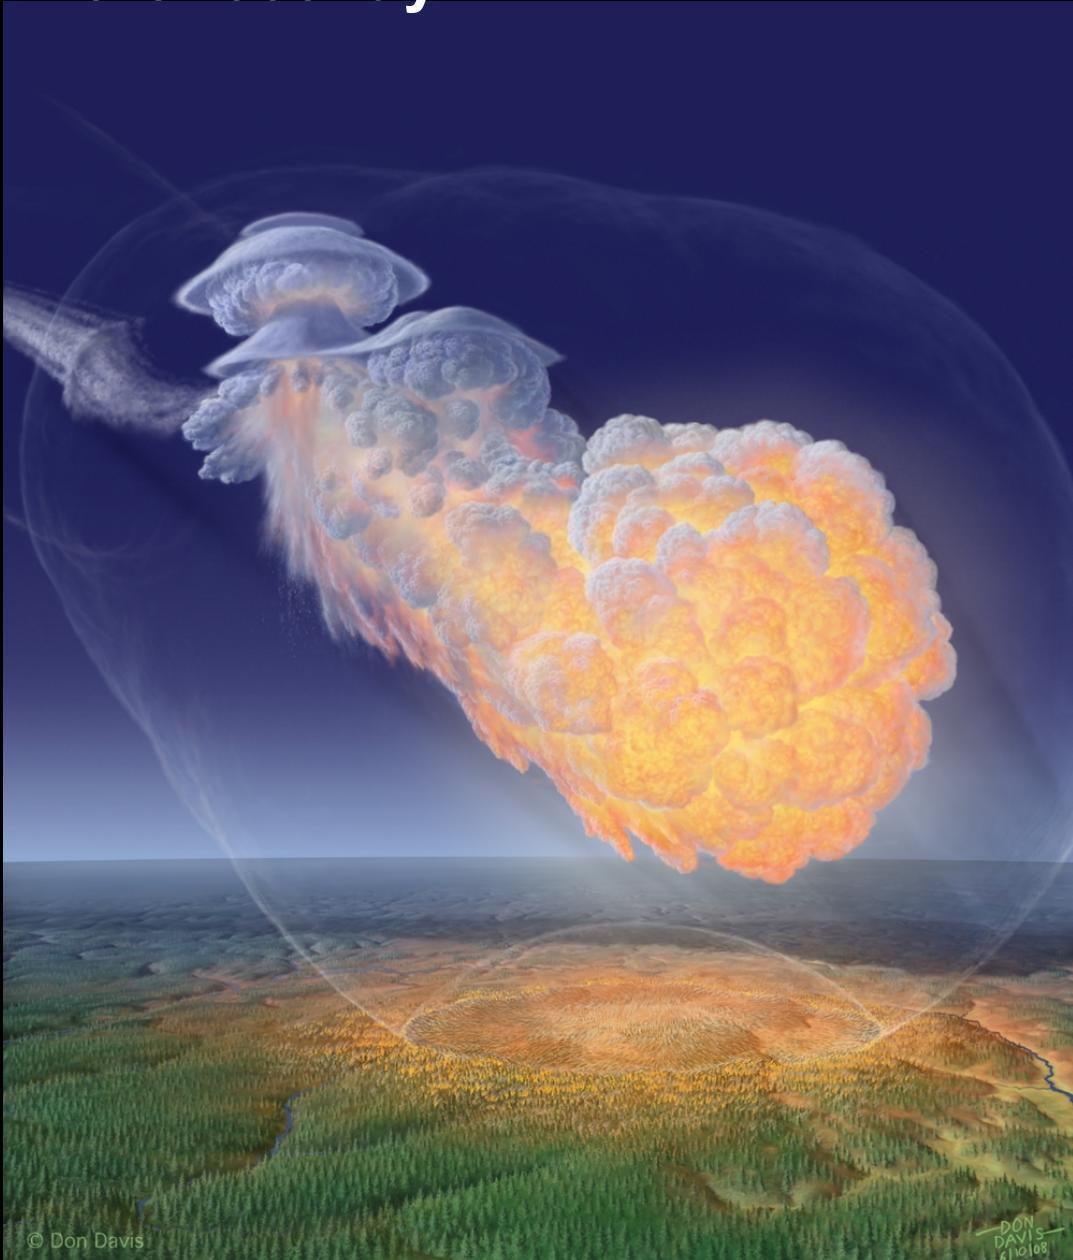

Chicxulub crater, Yucatan Peninsula
Gulf of Mexico

Asteroid Gaspra: 10 miles long
- the size of the Chicxulu impactor

**Massive extinctions!!!
(75% biomass on K-T boundary)**

More recently...

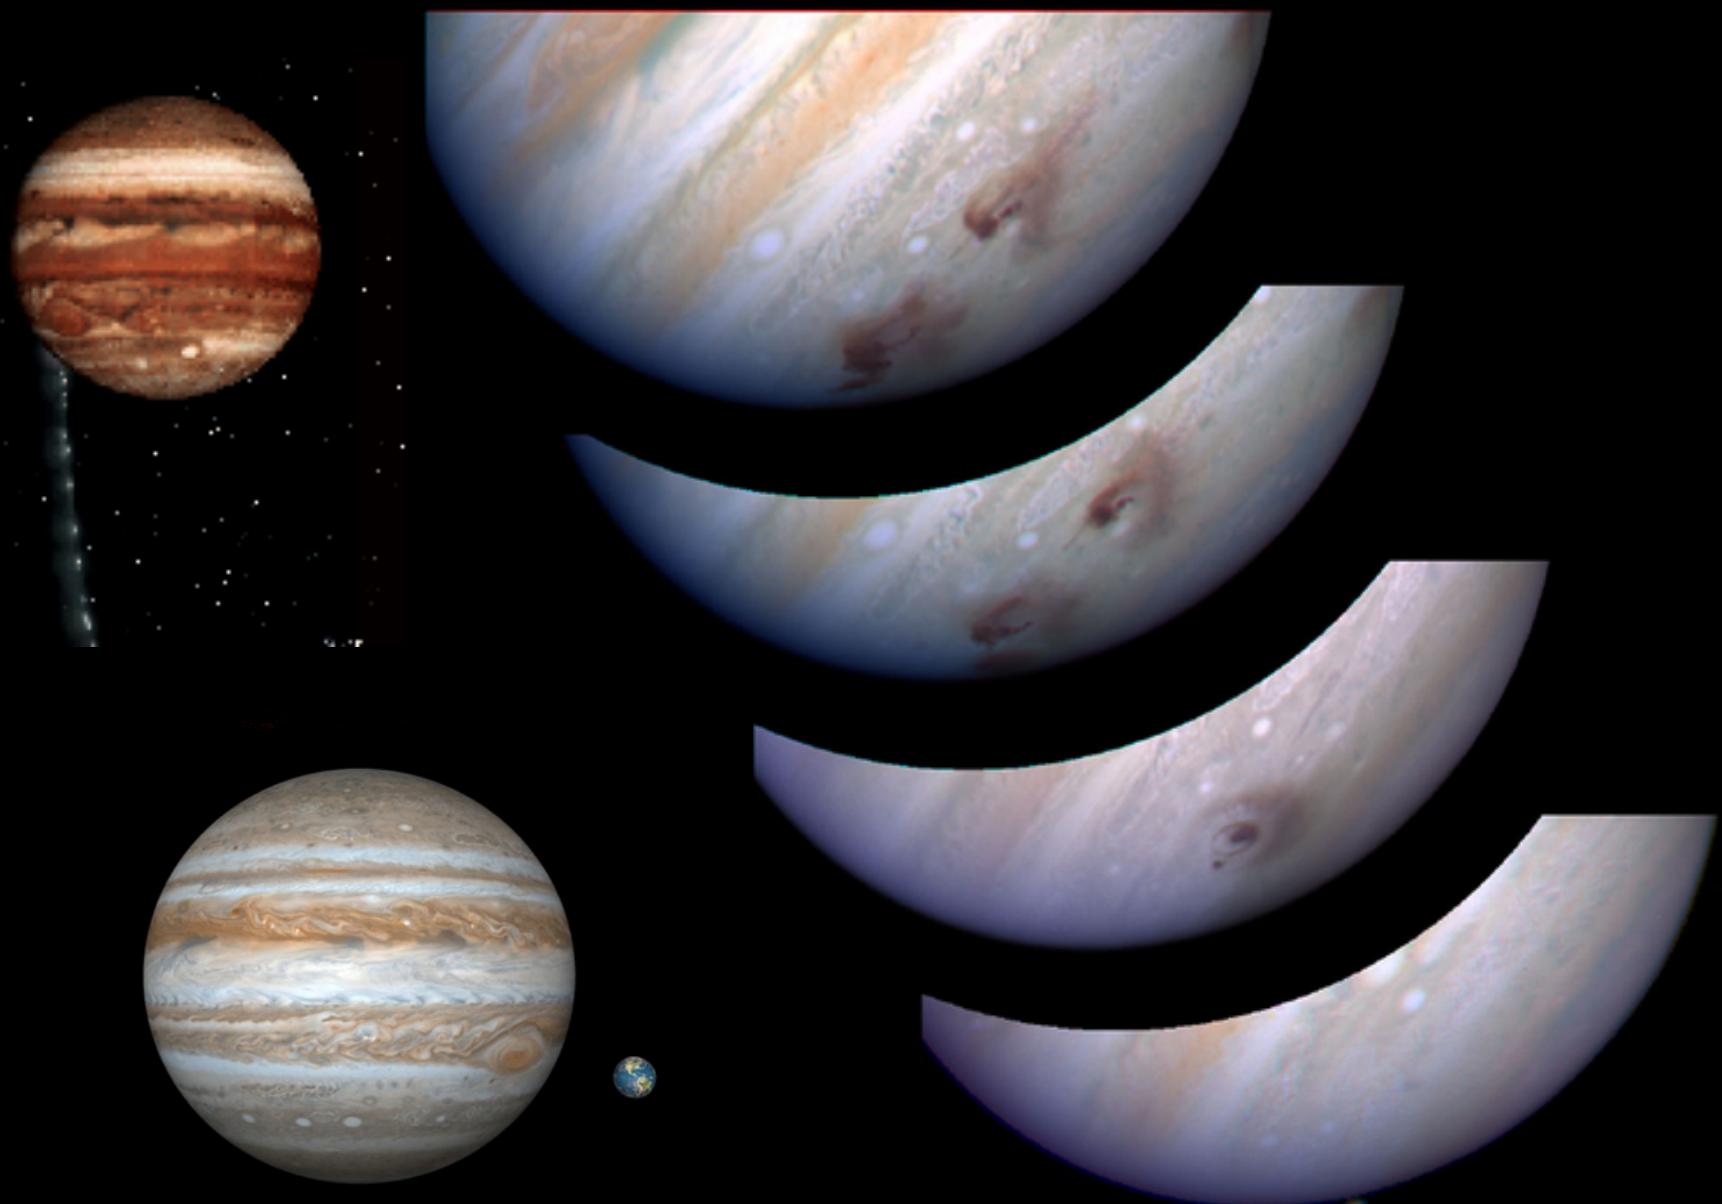

Tunguska, Siberia (30/06/1908)

Object 20-30 m diameter
Exploded in the air
Released energy \sim 10 MT
Observed over all Europe and
recorded by sismometers
Knock down trees over 2000 km²
Fires

Impact of Comet Shoemaker Levy 9 in Jupiter on 1994

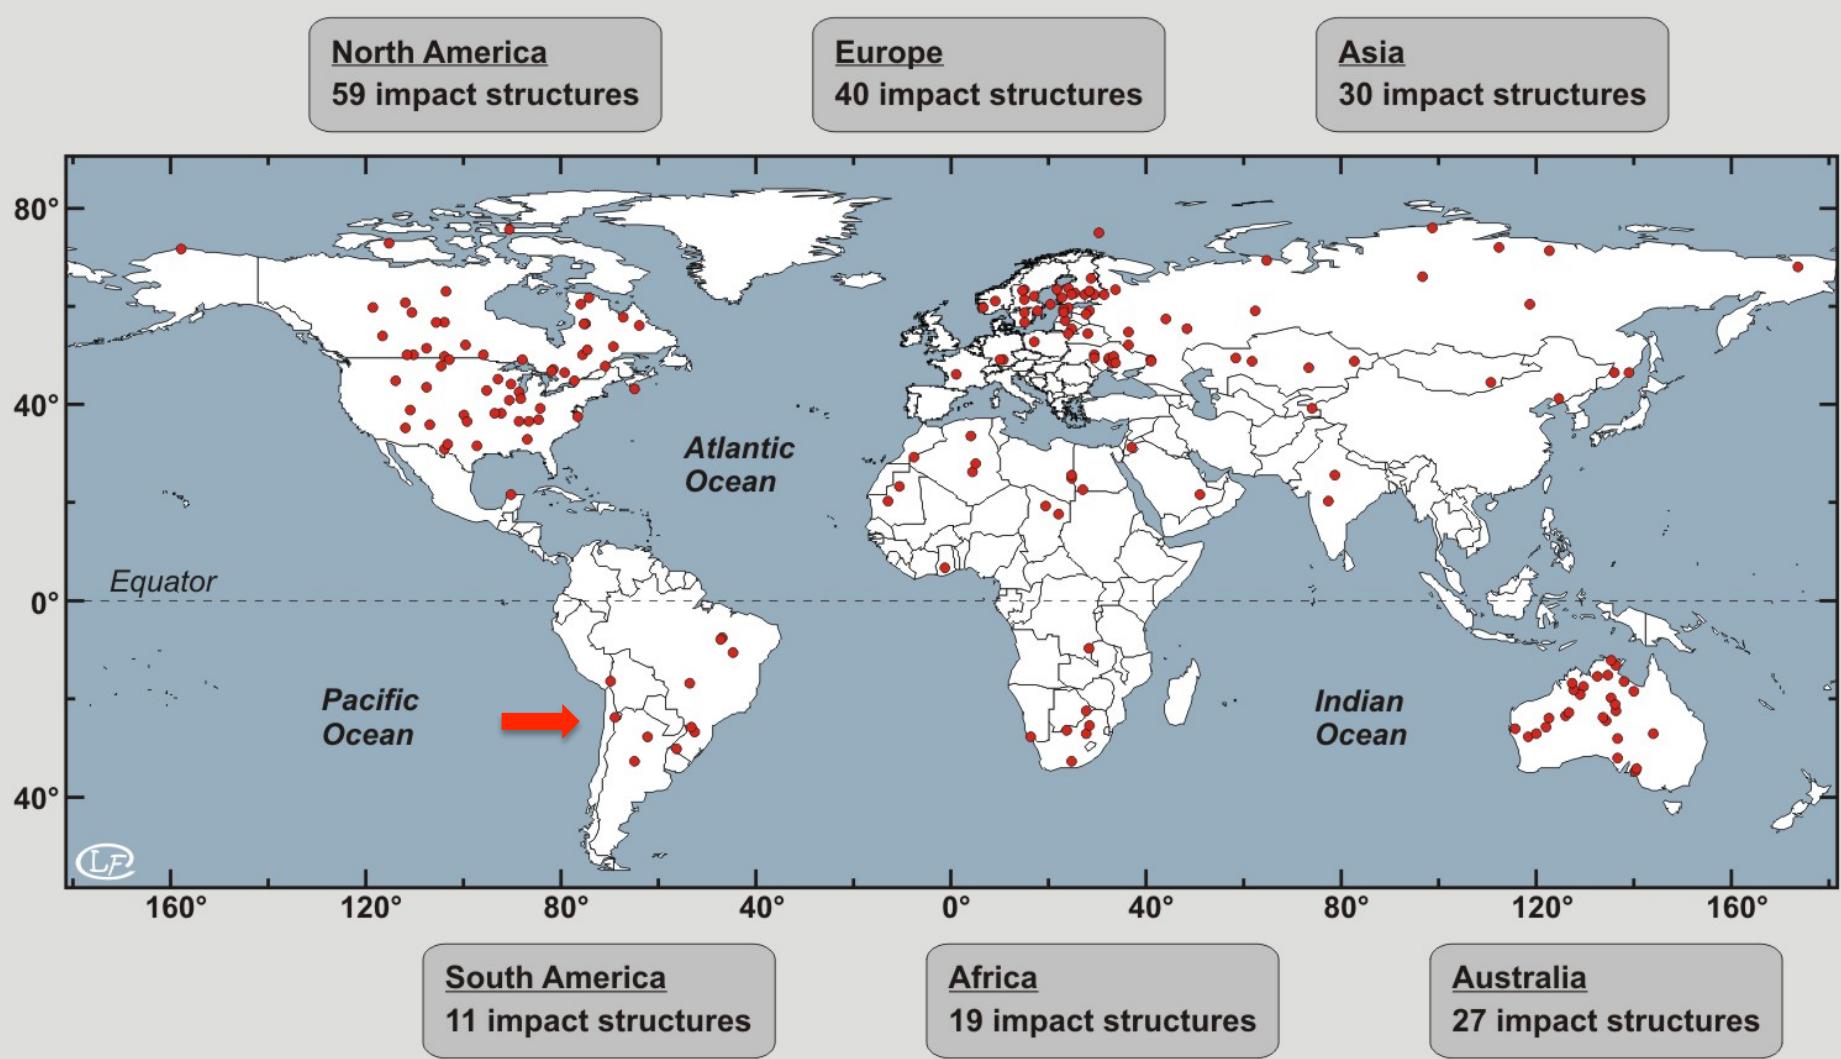

Chelyabinsk airburst and fall, Russia, February 2013

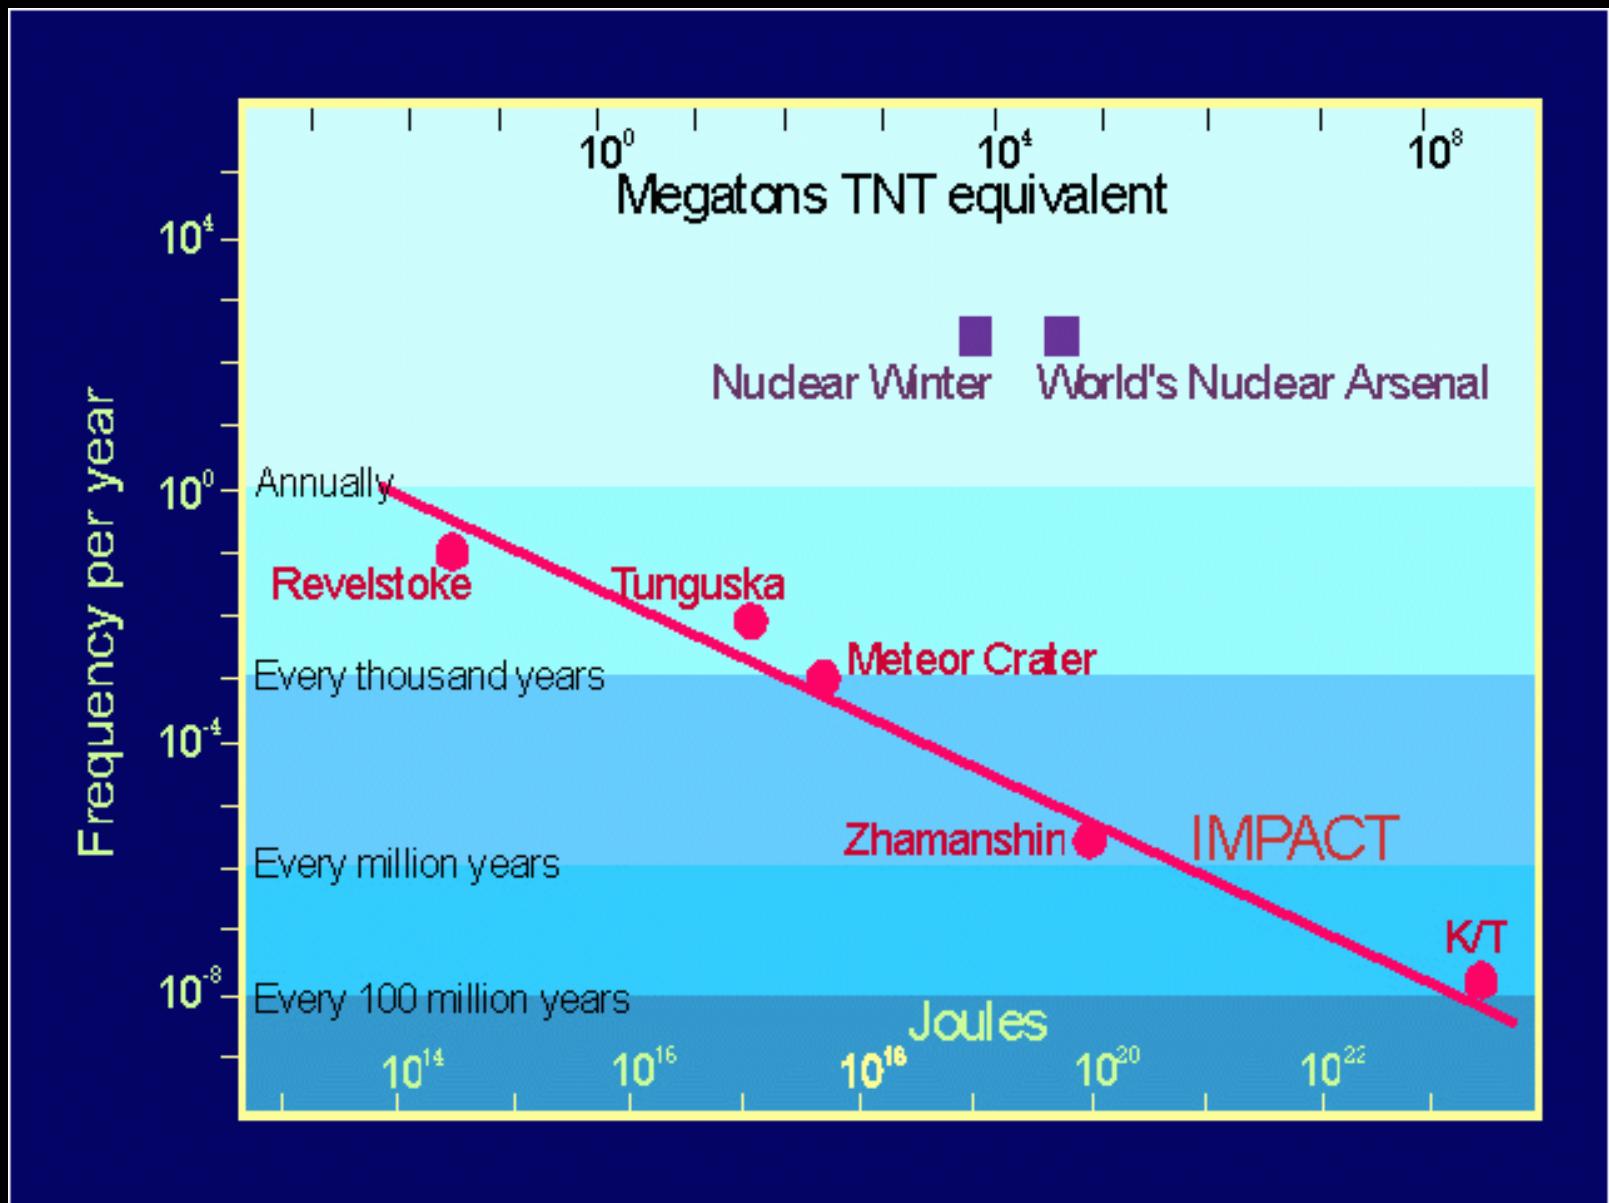

Object 20m diameter exploded in the air generating a shock wave that made explode windows (+ de 1000 people injured)
Released energy ~ 500 kT
Biggest meteorite found: 650 ton
- Ordinary chondrite

Earth

Earth

**Flux of Extraterrestrial
material to Earth
 $10^4 - 10^7$ ton/año**

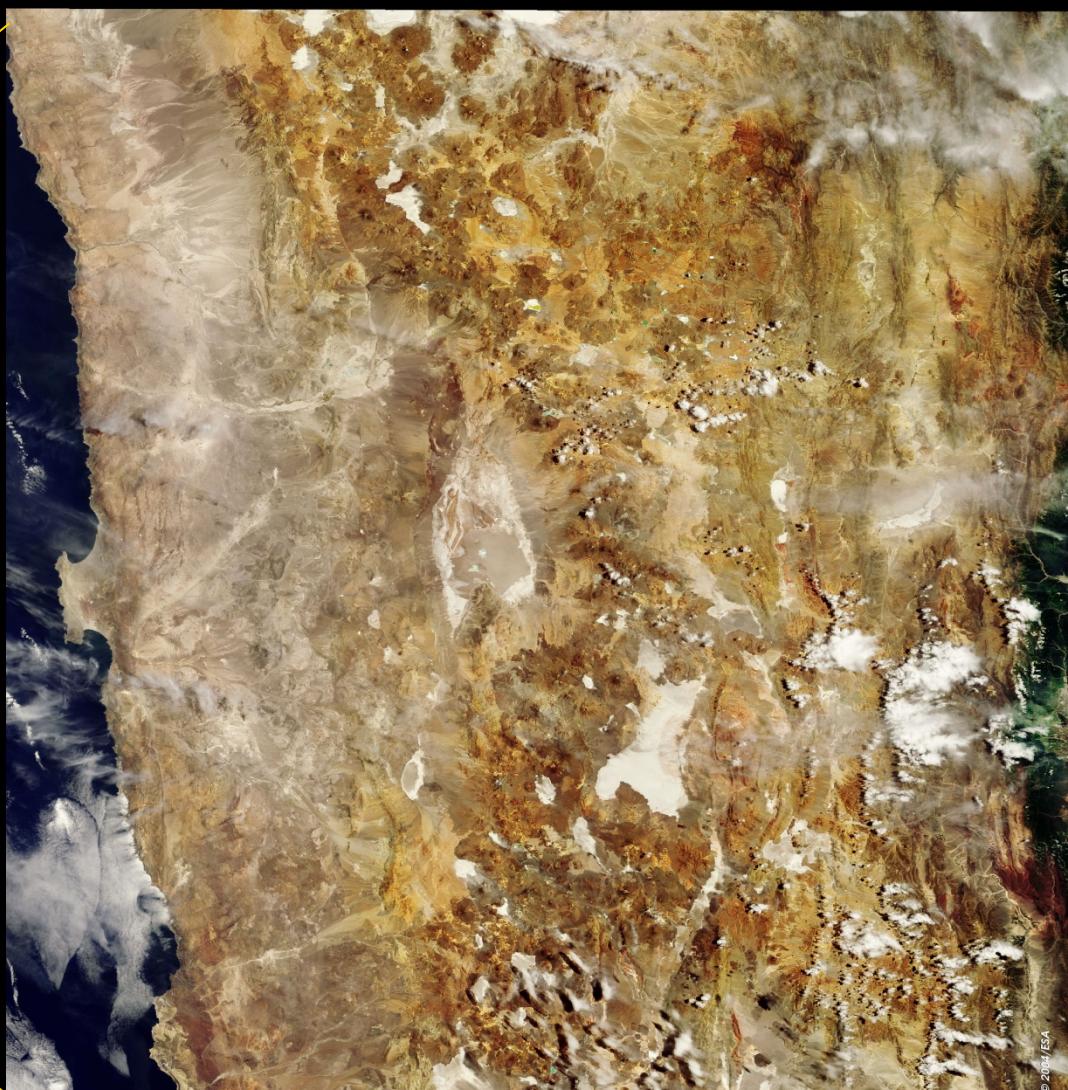

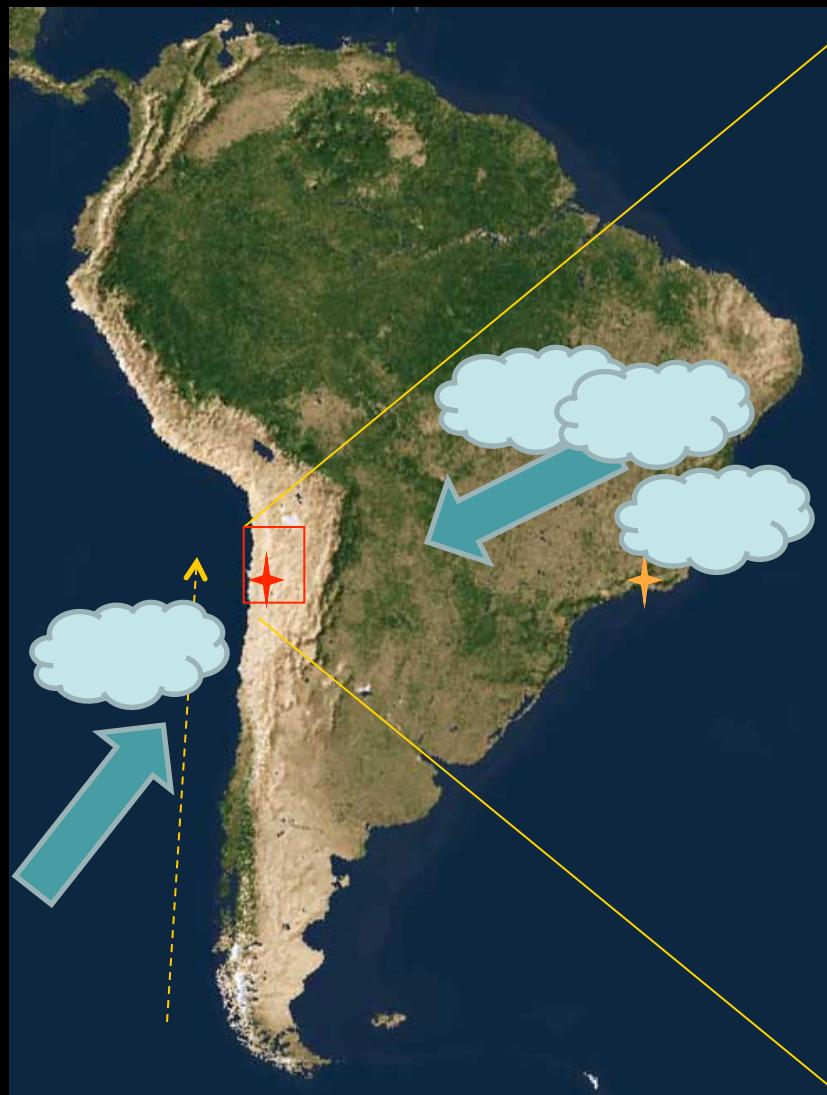

**Just 1% of that
material is recoverable**

Random fall

Preferential accumulation

in deserts

The driest desert in the world: ATACAMA

Location

10 years of findings!
From 60 meteorites
in the chilean collision
to more than 600

Monturaqui Crater

South of Atacama Salar (II región)
Descubierto en 1966 (Sanchez y Cassidy)

Edad: 600.000 años

Diámetro (km): 0.46

Meteorito impactor corresponde a un siderito
del tipo Octahedrita IAB

Expedición Diciembre 2003
U de Chile – U. De Toronto

Now trying to presented as a Natural Monument to protect it
Personally I'd like a planetary sciences educational station there!
(Need sponsors!!)

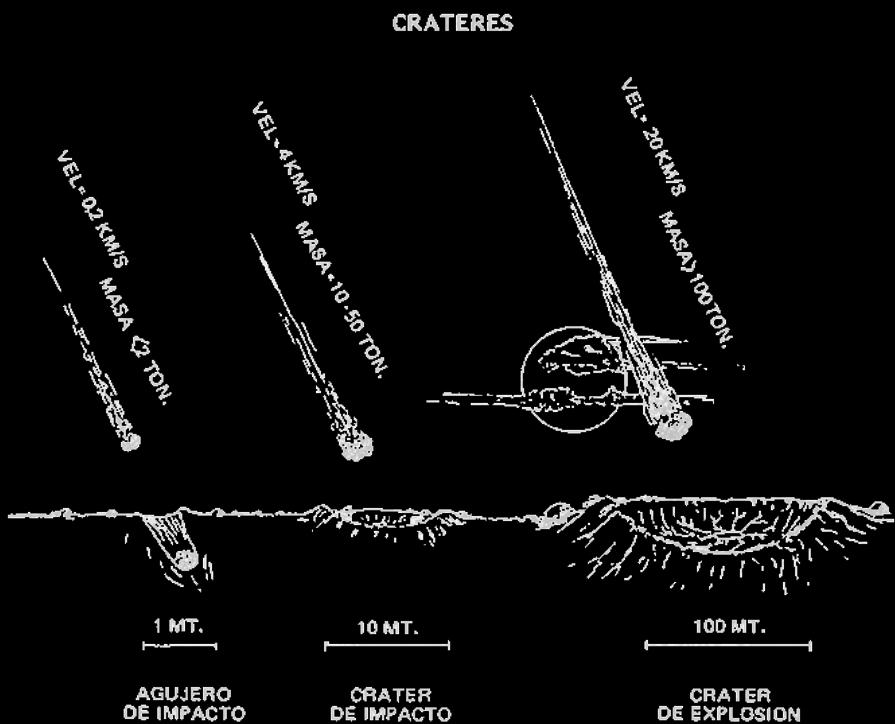

Case: Meteor (or Barringer) Crater, Arizona

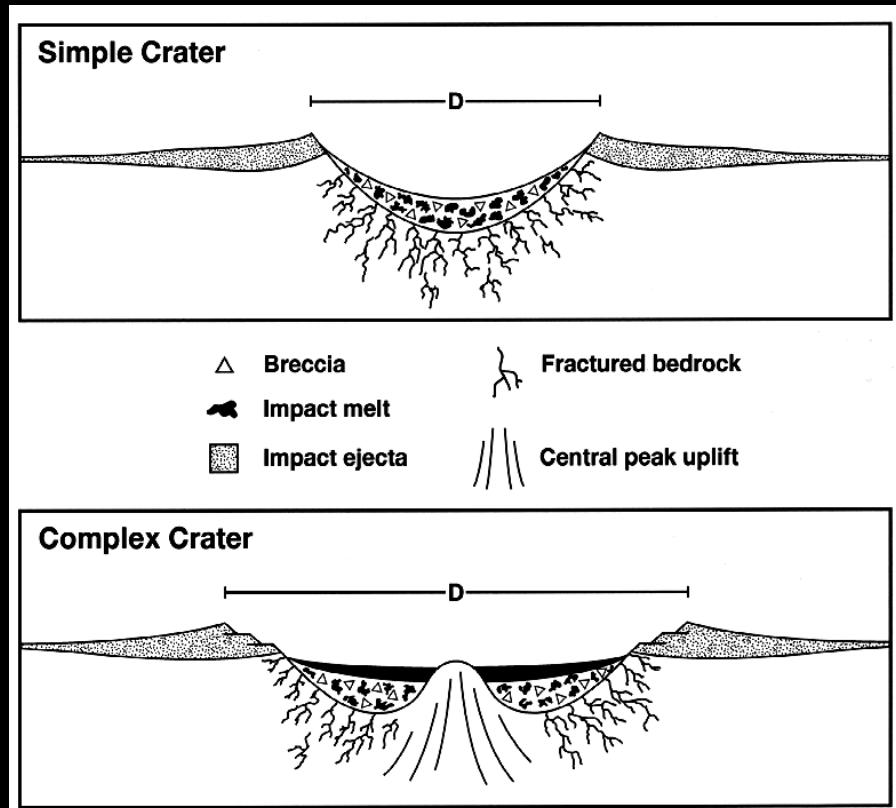

And its interactive Visitor Center

French 2008

www.museodelmeteorito.cl

Crater Imilac

(II región – 1820 aprox)

Diametro/profundidad: 15m / 4m

Edad: ?

Meteorito impactor corresponde a un mesosiderito del tipo Palasita

IMILAC
PALASITA
MATRIZ INTERNA

www.museodelmeteorito.cl

Cráteres Vaca Muerta (II región - 1861)

Diámetro/profundidad: 9,3 a 7,2 m / 1 a 2 m

Edad: ?

Meteorito impactor corresponde a un mesosiderito

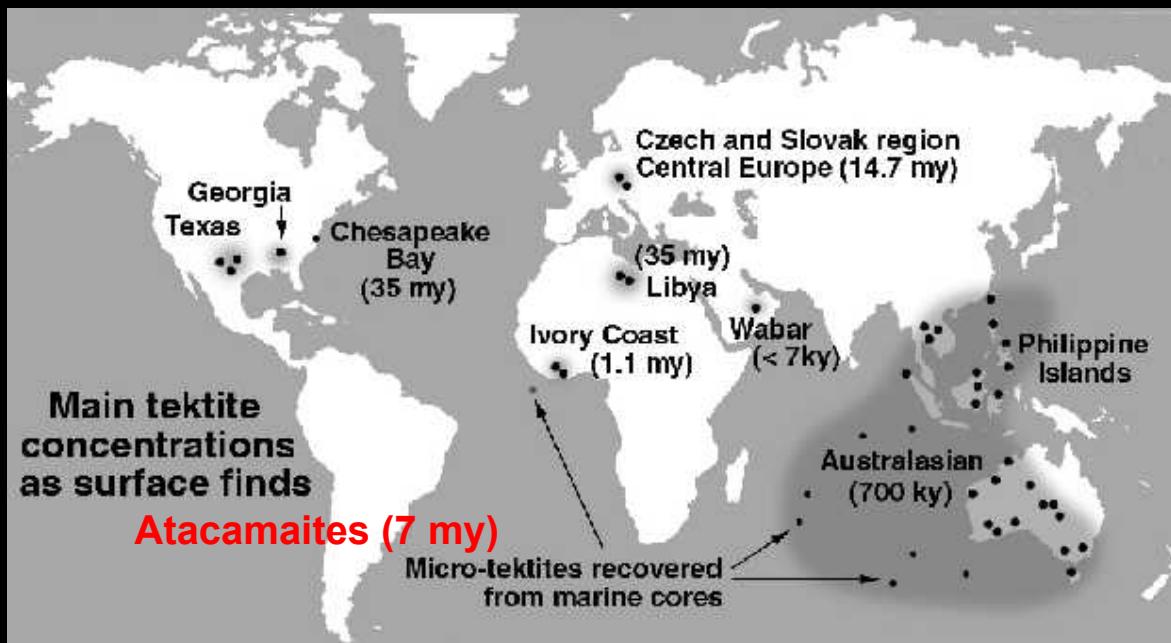

VACA MUERTA
MESOSIDERITO
CRISTALES DE OLIVINO

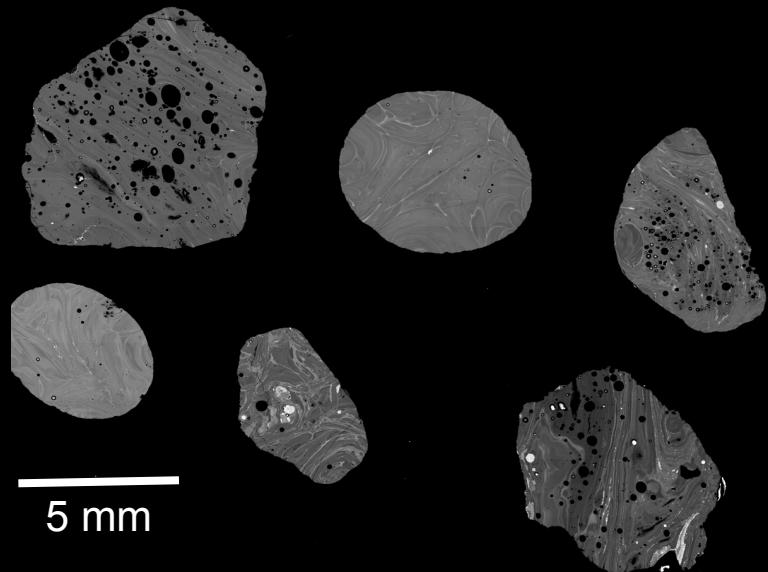

Discovery of melt glasses with aerodynamical form → possible tektite-like ejecta or impact glasses (~7 My)

New tektite field? Proposed name ATACAMAITES

Atacamaites

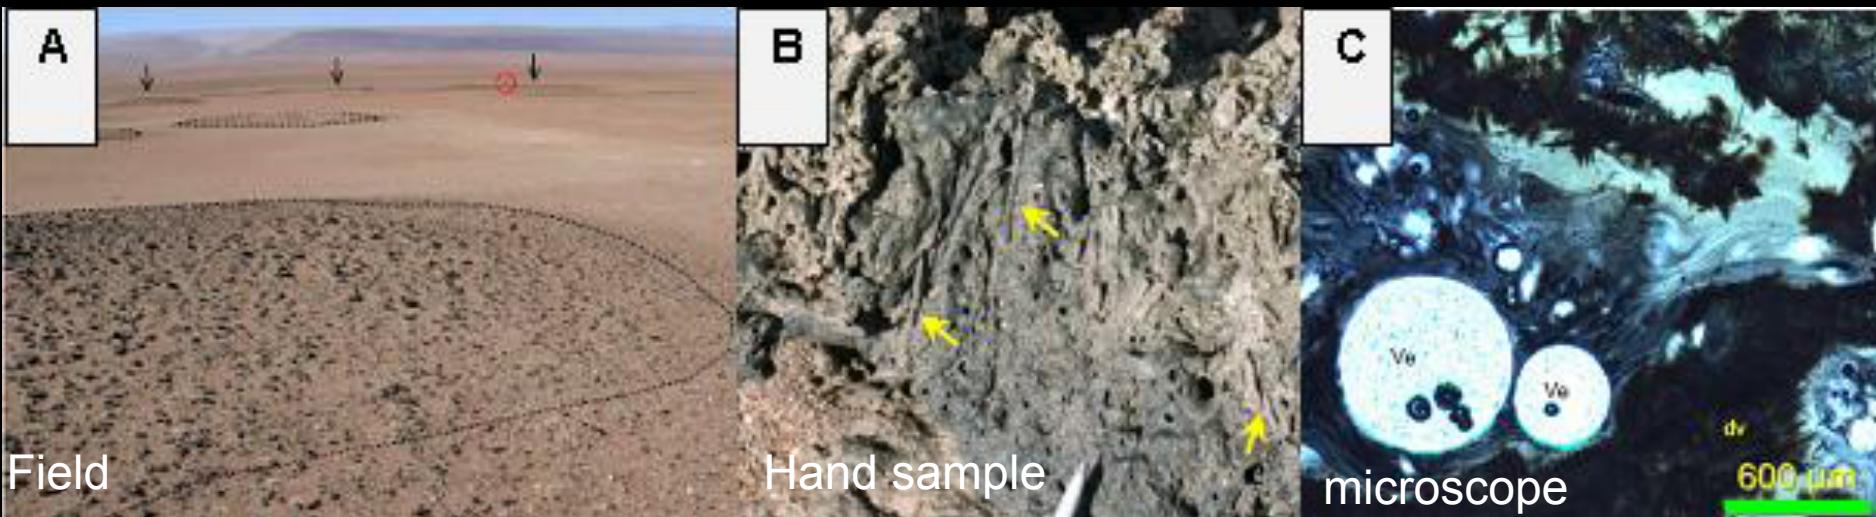

No crater identified yet
(can be covered by sediments,
lavas etc)

Discovery of impact ? glasses

- During mapping of a regional chart, two senior geologists from the Chilean Geological Service discovered in 2011 patchy deposits of glasses, total extension of 60 km, in the vicinity of the Andes precordillera. Baked red soils deposits were also found associated with them, but not displayed in all the localities.

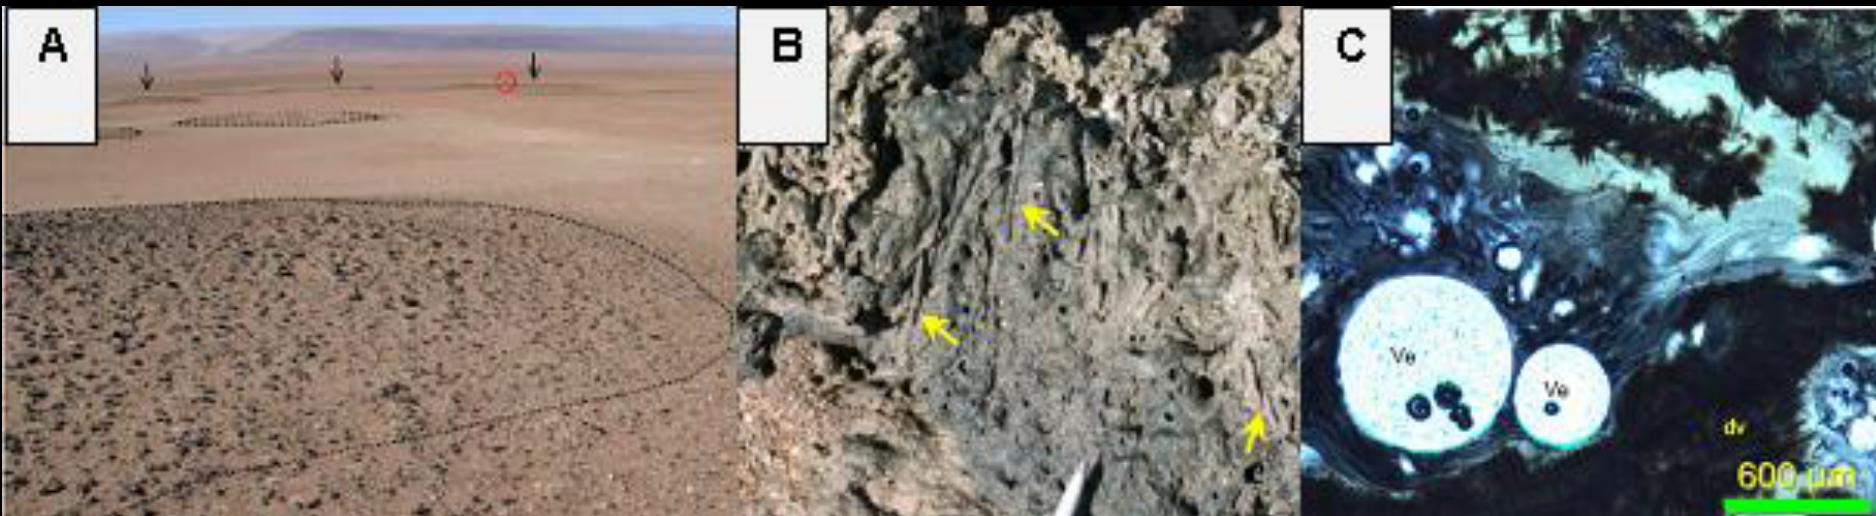

Melt glasses found in northern Chile:
To do glasses → high T° and quick cooling
possible origins:

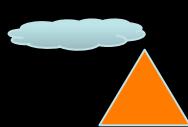

- Fulgurites
- Volcanic activity
- Human slags
- Airburst

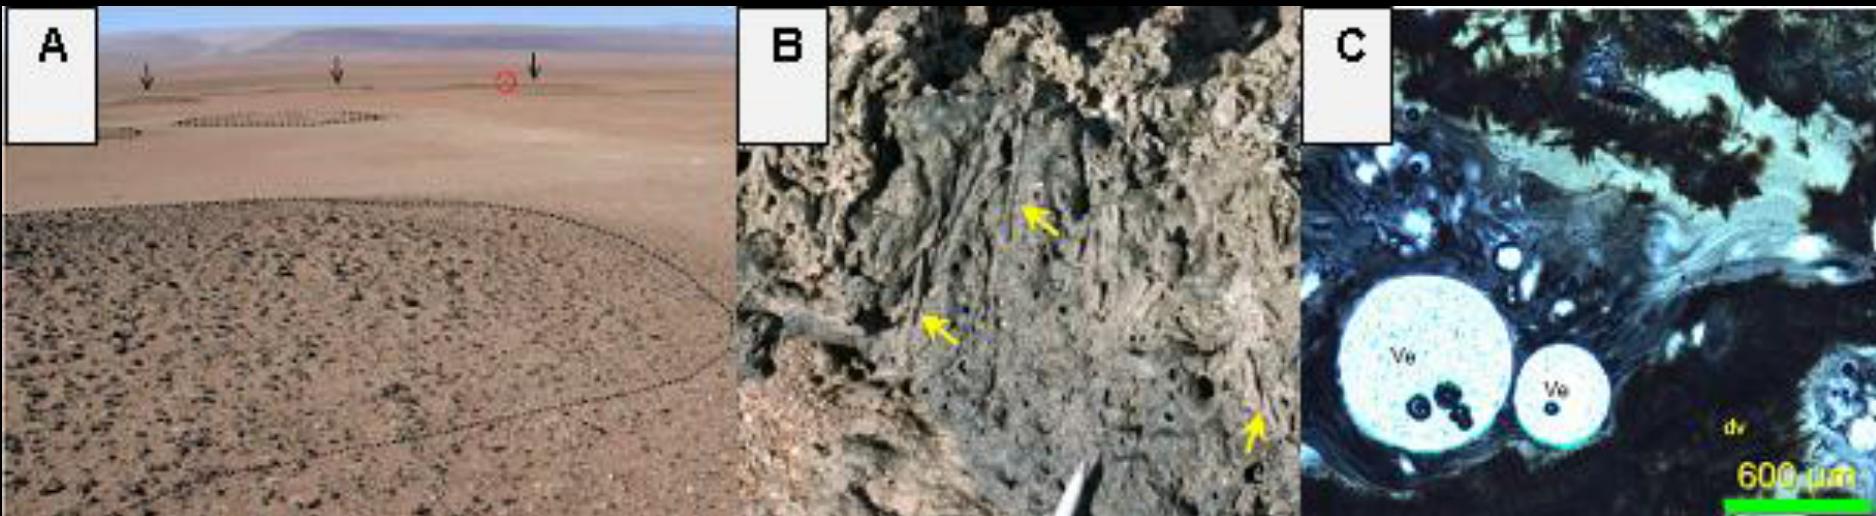

Melt glasses found in northern Chile:
To do glasses → high T° and quick cooling
possible origins:

Fulgorites
Volcanic activity
Human slags
Airburst

Volcanic range
at 70 km to E
Ruled out by
geological
observations

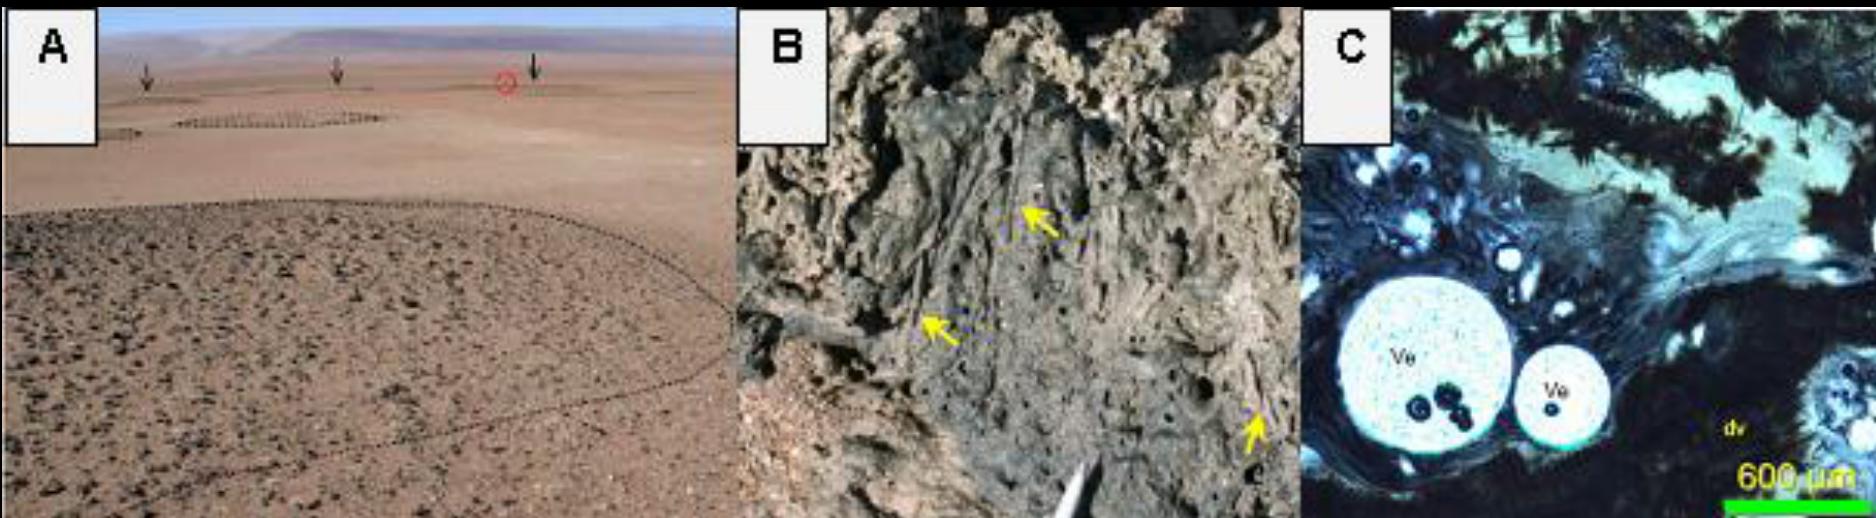

Melt glasses found in northern Chile:
To do glasses → high T° and quick cooling
possible origins:

- Fulgorites
- Volcanic activity
- Human slags
- Airburst

No vestiges of such kind of human activity in this area

Melt glasses found in northern Chile:
To do glasses → high T° and quick cooling
possible origins:

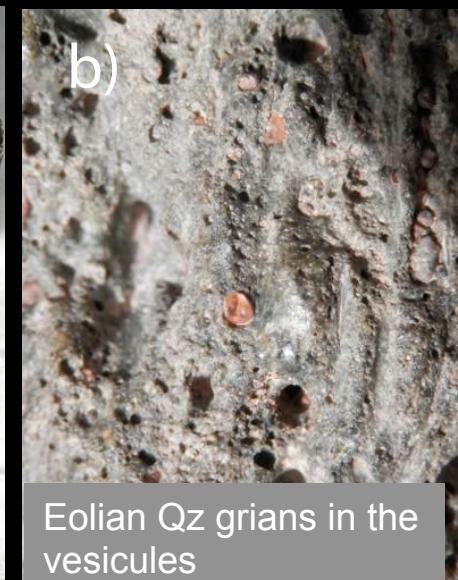

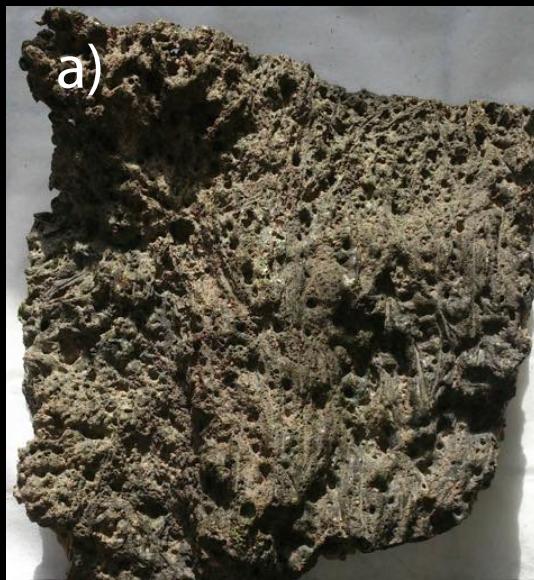

Fulgurites
Volcanic activity
Human slags
Airburst

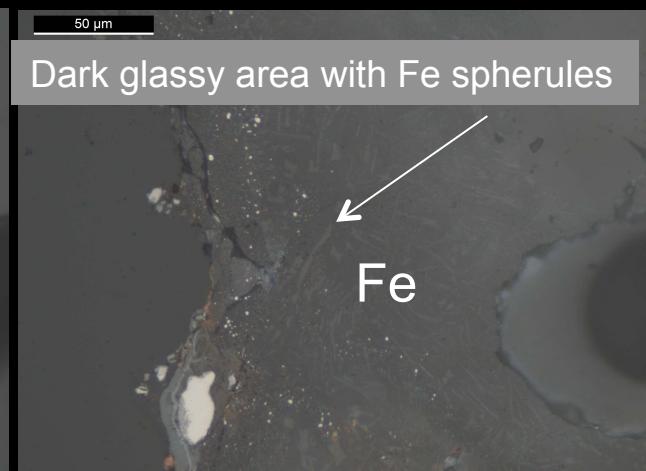

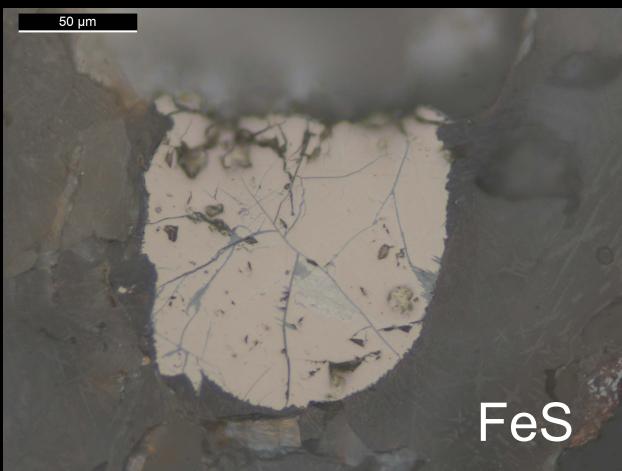

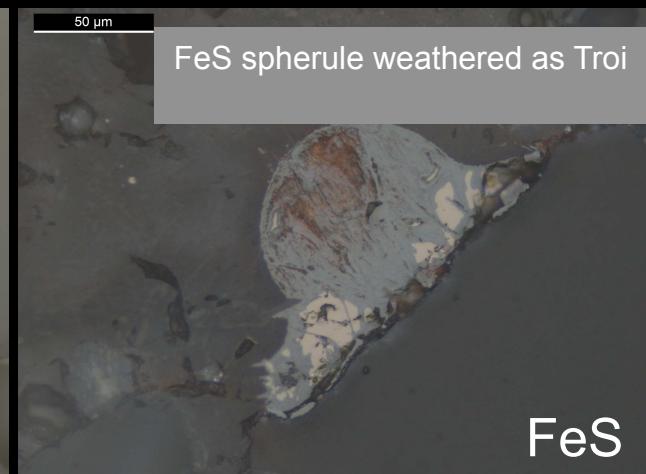

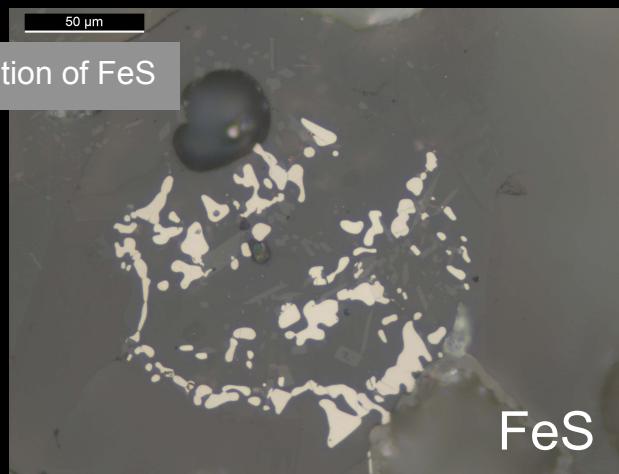

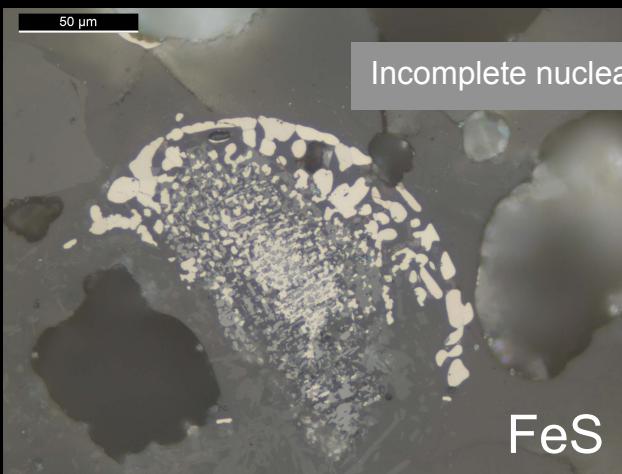

Preliminary results: hand samples

Transition from sandy bottom to pure green glass to the surface

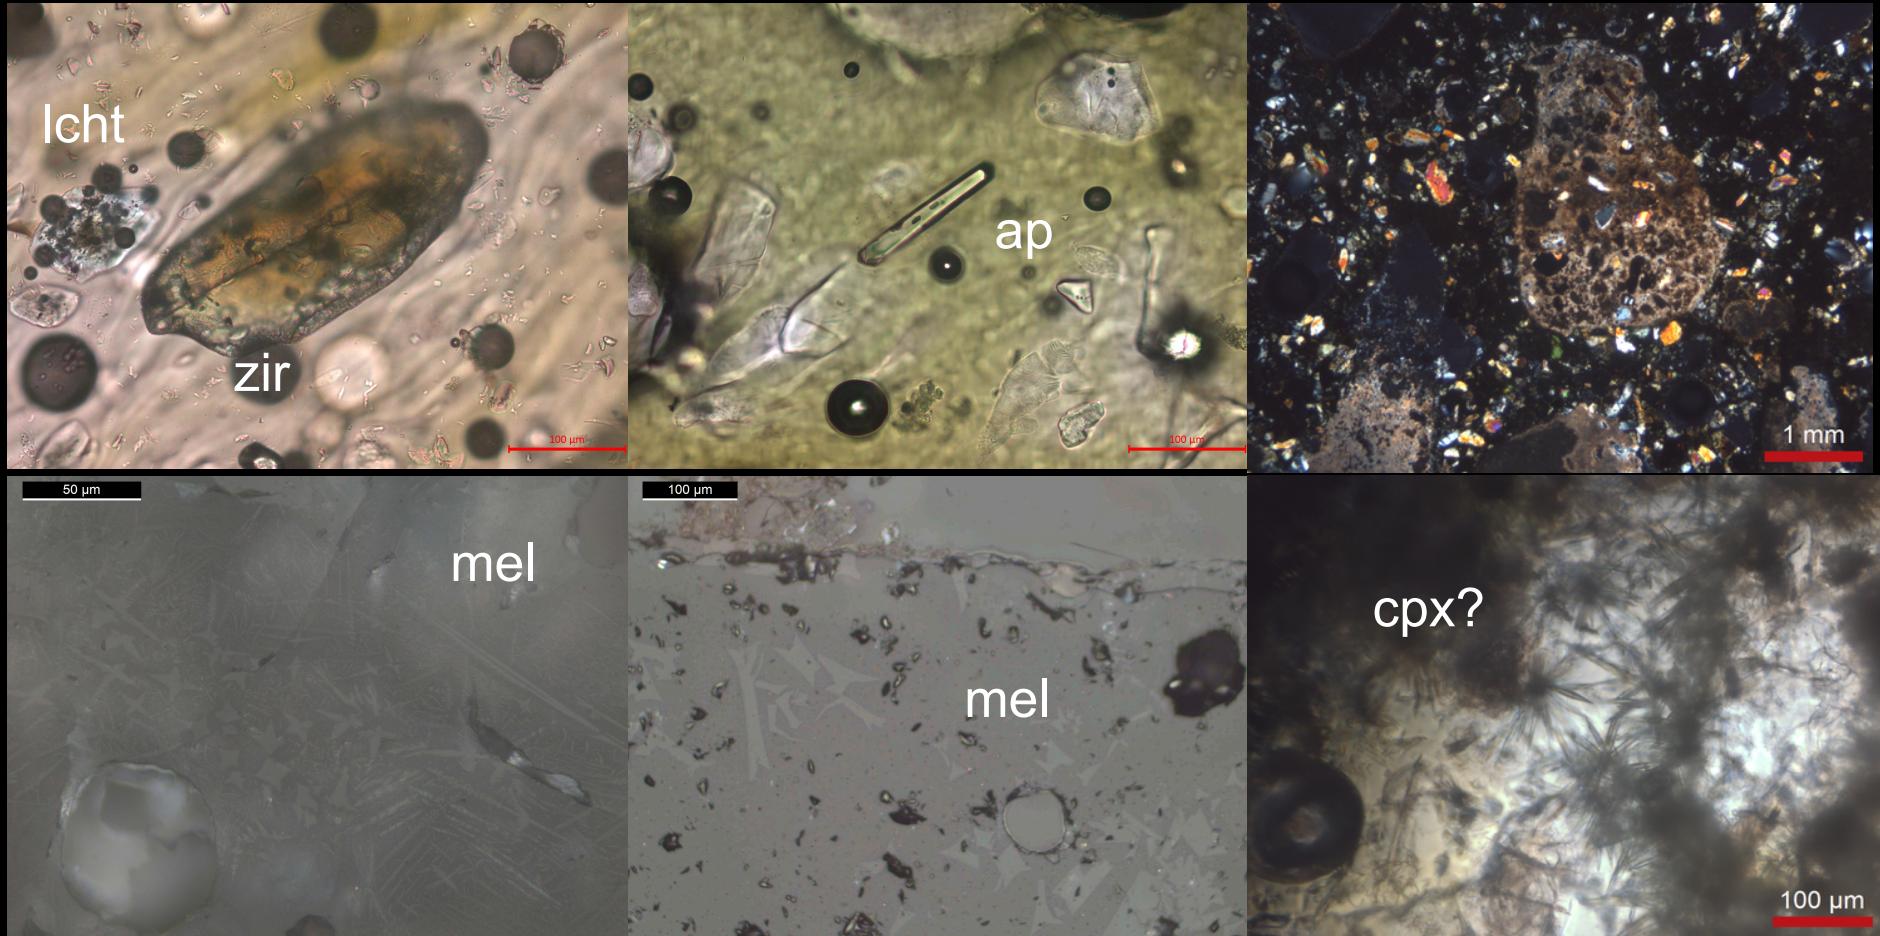

Opaques: iron sulphides, magnetite, phosphides, Fe, chromite

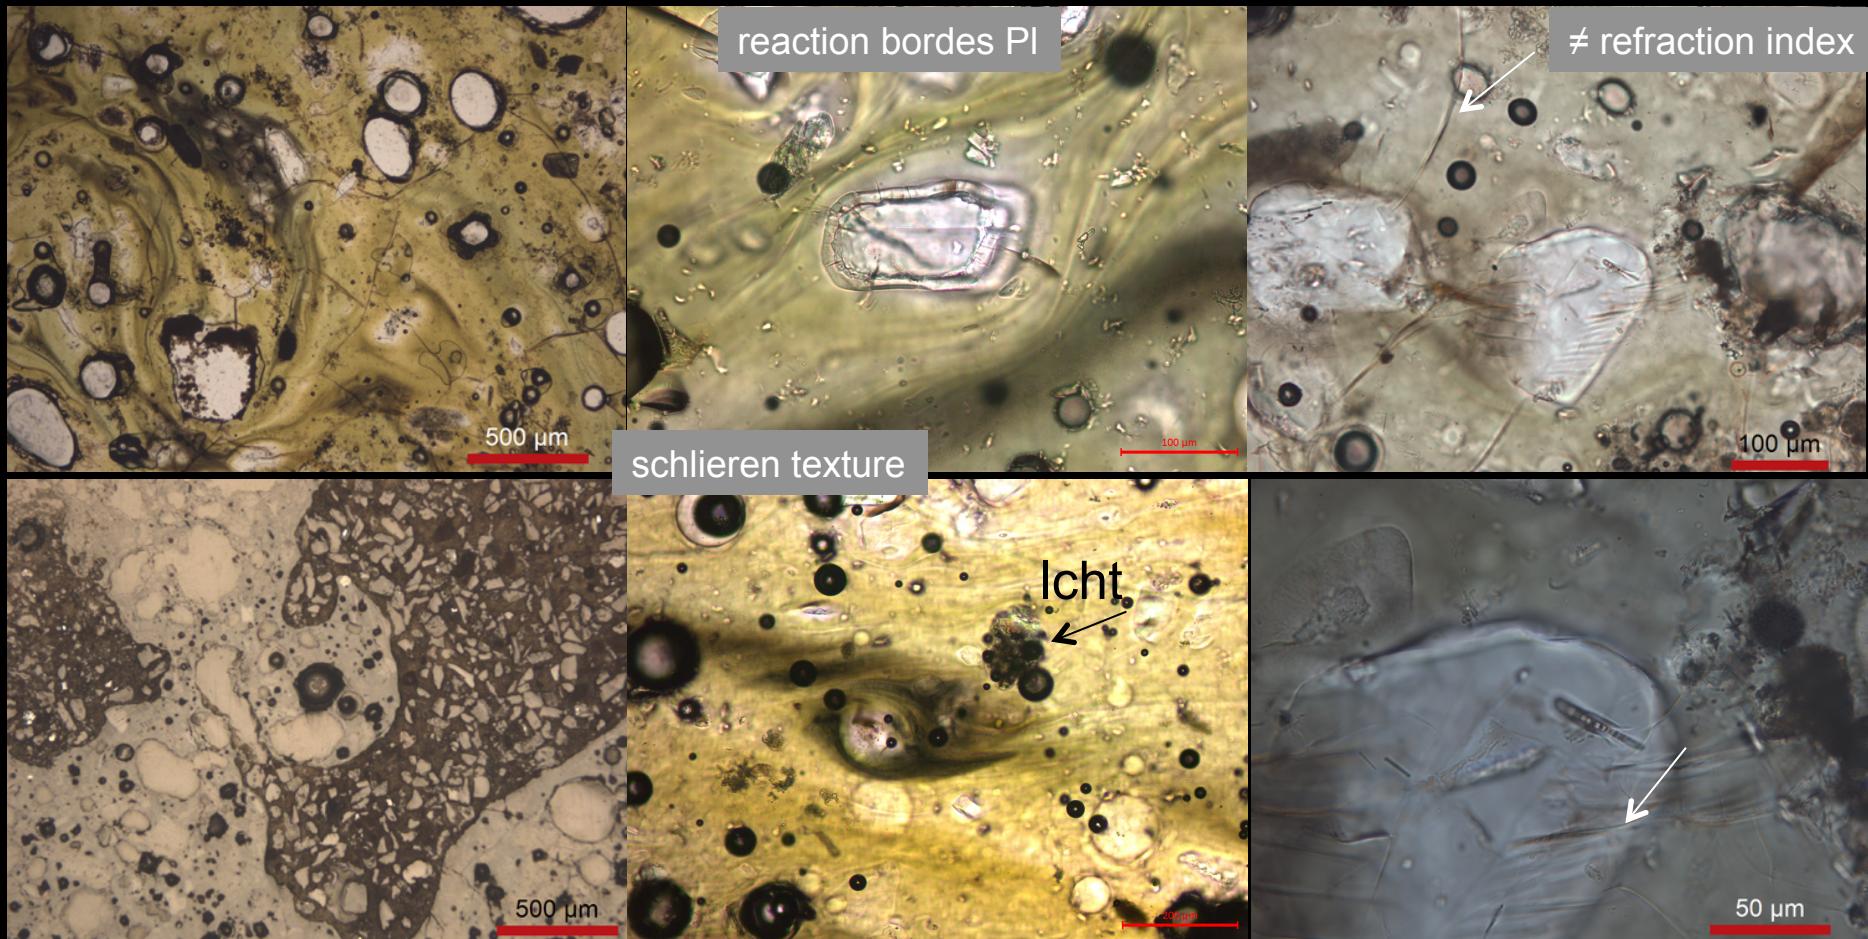

Magnetite often part of the breccia clast, or the cement. FeS and FeP developed in the borders of vesicles

Minerals: Relicts fragm crystals (from target deposit): plаг + qzo + px + anf + K-Fd + Ti + ap + zir

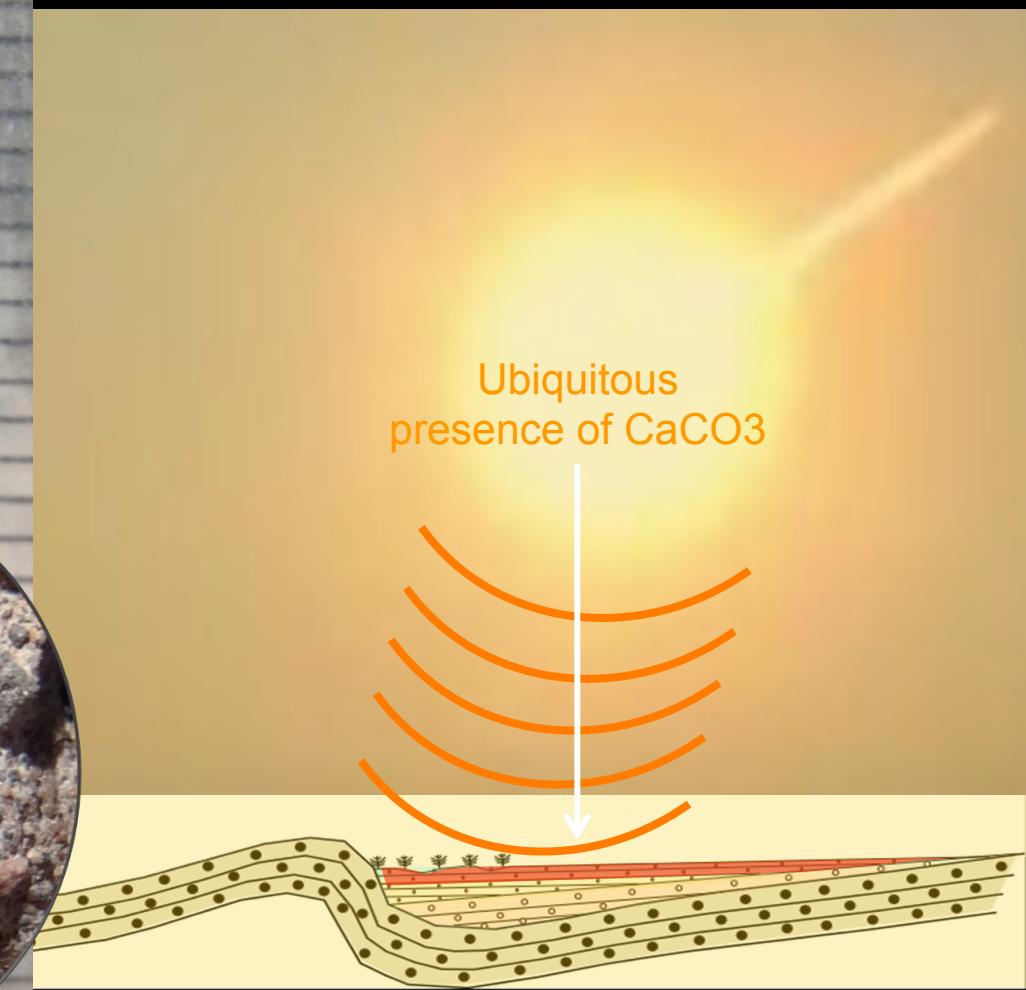

Neoformed: diaplectic glass: lechatelierite + melilite crystalites

Others: Fluid texture in the glass, reaction borders in relict grains, different refraction indexes in the glass, presence of breccia fragments with fractured crystals (suevite?), planar fractures in some crystals.

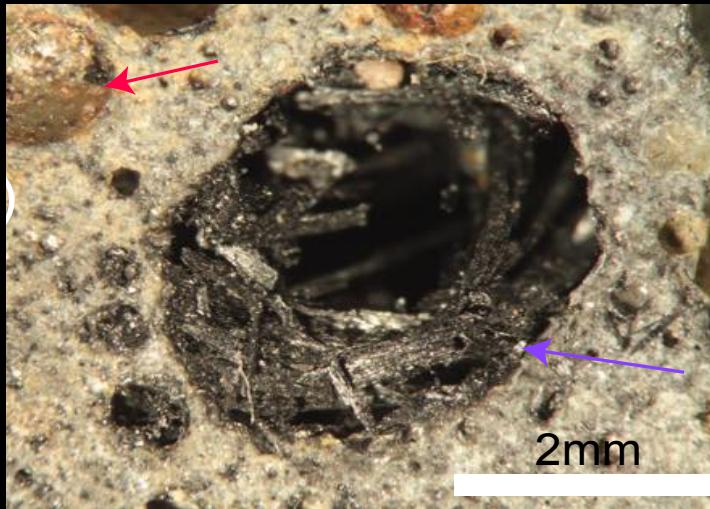

Possible models to explain distribution glasses

Geology, mineralogy needed to put constraints

The astrobiology perspective of these studies

Plants inside the glasses

Geology, published online on 15 April 2014 as doi:10.1130/G35343.1

Preserved flora and organics in impact melt breccias

P.H. Schultz^{1*}, R. Scott Harris², S.J. Clemett³, K.L. Thomas-Keprta³, and M. Zárate⁴

Similar glasses found in Argentina
at different layers → different ages

Conditions to preserve organic material:
ultra-high T° (>1500°C) + rapid quenching

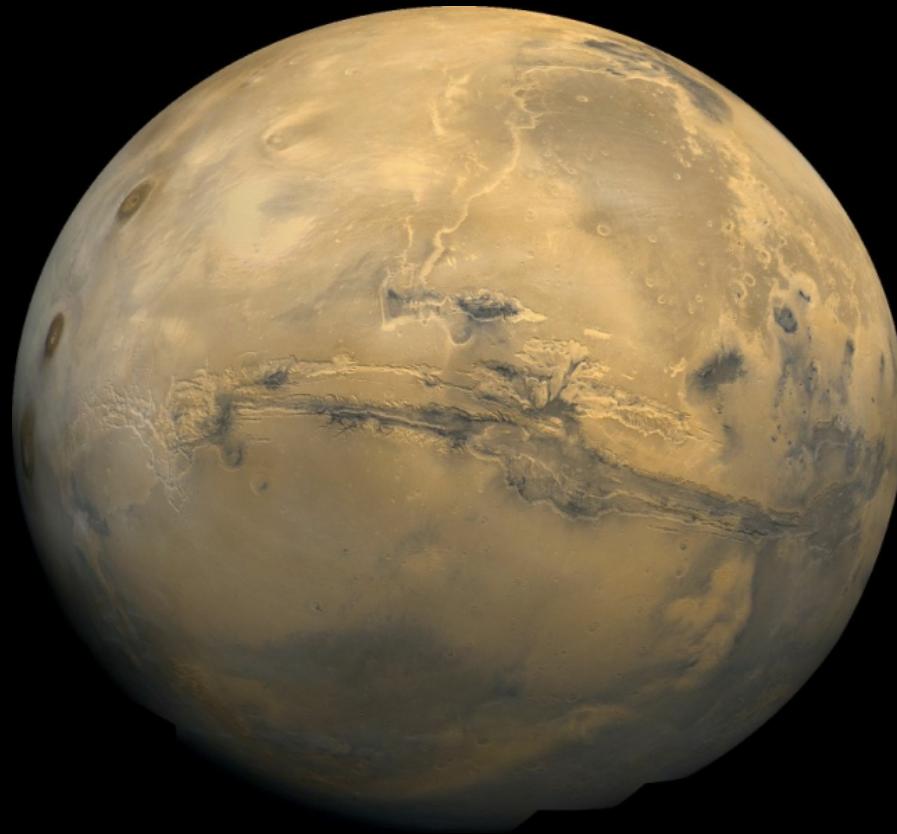

Little animals associated to that layer

Under study now (field trip just 2 weeks ago)

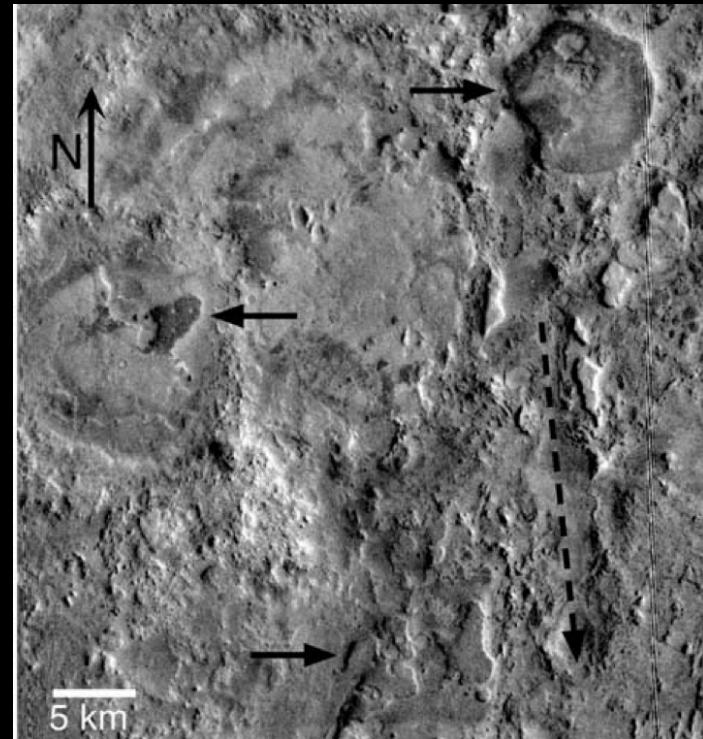

- Ages (14C)
- Petrology
- Paleomagnetic measurements

The astrobiology perspective of these studies

New targets to look for life in Mars!

Because the target rocks are compared to sediments on Earth that generate melt glasses

Impact melts and glasses on Mars
