

P2PP3 Quiz:

1. In the old P2PP the OB name had to be edited in the OB view/edit window. How is it done in the new P2PP?
Hint: there are three possible answers.
2. The execution time displayed in the OB view window after selecting the "Recalculate" button may be different from the execution time for the same OB when it is selected in the main P2PP3 window. Which scheduling container does this OB belong to?
3. Is it possible to choose the order in which the concatenated OBs will be executed? How to re-order the OBs?
4. Can I check-out only one OB that belongs to a group in order to revise that OB? The other OBs do not require any changes...
5. What do time delays in time-linked OBs refer to: first OB in a sequence or the previous OB?
6. What is the maximum length of the interval within a time link container? In other words, how to set-up the requirement to have "at least 10 days" separation between OBs but no maximum time separation?
7. How to set-up the observing strategy in order to get one OB observed per week for 4 weeks in a row? How is this different from the case when one wants to monitor the target once per month for 6 months in a row?
8. How to set priorities between different OBs in P2PP? Is it possible to set the priority for OBs in a container?
9. Is it possible to import targets from the phase I proposal? How?
10. I want to observe my target at several different epochs taken on different nights, but each time I observe the target, I also want to observe a telluric standard. How do I do that?
